1. General Information

All reactions were carried out with the open atmosphere in flame-dried glassware. DMF solvent was used LR grade and all reagents, solvents were purchased from commercial suppliers and Sigma Aldrich, Alfa easer, Avra synthesis. All these commercially available chemicals were used without further purification. The variety of 2-methyl benziimidazole were synthesized from commercially available various o-Phenylenediamine by using the following literature procedure.¹

Analytical thin layer chromatography was performed on TLC Silica gel 60 F254. And routine monitoring of reaction was performed by TLC using 0.25 mm E. Merck pre-coated silica gel TLC plates (60 F254) using UV light to visualize the course of the reactions or KMnO4 staining solutions followed by heating. Column Chromatography was performed on silica gel (60-120 mesh) by standard techniques eluting with solvents as indicated.

All compounds were fully characterized by using $^1$H and $^{13}$C NMR, the spectra were recorded at 200, 400, 500 MHz and 50 MHz spectrometer using CDCl$_3$ as solvent at room temperature. The compound 4q and 5d were characterized by single crystal X-ray analysis of their structural configuration. Chemical shifts (δ) are reported in ppm with TMS as internal standard. Abbreviations for signal couplings are: s, singlet; d, doublet; t, triplet; m, multiplet. q, quartet etc.

2. General Procedures for the Optimization of the Reaction Conditions

To a 10 ml round bottom flask equipped with a magnetic stir bar was added 1a (1 mmol), 2a (1.2 mmol), 3a (1.2 mmol) and Catalysts (20 mol %) were taken and added solvents (5 mL), later RBF was capped with condenser. The reaction mixture was reflux at oil bath temperature, and the progress of the reaction was monitored by TLC with reaction time as shown in reaction optimization condition (Table No.1). After the completion of the reaction, the reaction mixture was diluted with 10 mL water and 10 mL ethyl acetate, stirred for 10 minutes. The organic layer and aqueous layer were separated. The organic layer was dried over anhydrous Na$_2$SO$_4$. The solvent was evaporated and the crude residue was purified by column chromatography on silica gel to afford the corresponding desired compound (4a) in moderate to good yields.

3. General Experimental Procedures for the Synthesis of 4a to 4q

![Chemical Reaction Diagram]

To a 10 ml round bottom flask equipped with a magnetic stir bar was added isatins 1a (1 mmol), azaarenes 2a (1.2 mmol), malonontrile or ethylcyanoacetate 3a (1.2 mmol), SnCl$_2$.2H$_2$O (20 mol %) and DMF (5 mL), and RBF was capped with condenser. The resultant reaction solution was kept stirring at 110 °C in oil bath. The completion of the reaction was monitored by TLC. The completion of the reaction was observed in 8 to 10 h for 4a-4q. After the completion of the reaction, the reaction mixture was diluted with 10 mL water and 10 mL ethyl acetate, stirred for 10 minutes. Thereafter the organic layer and aqueous layer were separated. The
organic layer was dried over anhydrous Na$_2$SO$_4$. The solvent was evaporated and the crude residue was purified by column chromatography on silica gel to afford the corresponding desired compounds derivative (4a-4q) in moderate to good yields.

4. General Procedure for Cascade Reaction for the Synthesis for 5a-5j and 6a-6k

To a 10 ml round bottom flask equipped with a magnetic stir bar was added isatins 1a (1 mmol), malonontrile or ethylcyanoacetate 3a (1.2 mmol), SnCl$_2$.2H$_2$O (20 mol %) and DMF (5 mL), and the reaction mixture was stirred at ambient condition for 30 minutes followed by addition of 2-(azaaryl)methanes 2a (1.2 mmol). The resultant solution containing RBF equipped with condenser was kept for stirring at 110 °C in oil bath. The completion of the reaction was monitored by TLC. The completion of the reaction was observed in 6 to 8 h for 5a-5j. After the completion of the reaction, the reaction mixture was diluted with 10 mL water and 10 mL ethyl acetate, stirred for 10 minutes. Thereafter the organic layer and aqueous layer were separated. The organic layer was dried over anhydrous Na$_2$SO$_4$. The solvent was evaporated and the crude residue was purified by column chromatography on silica gel to afford the corresponding desired compounds derivative of (5a-5j and 6a-6k) in moderate to good yields.
5. Single Crystal X-ray data for Compound 4q, 5d

X-ray intensity data measurements of compound 4q and 5d were carried out on a Bruker SMART APEX II CCD diffractometer with graphite-monochromatized (MoK$_\alpha$ = 0.71073Å) radiation. The X-ray generator was operated at 50 kV and 30 mA. A preliminary set of cell constants and an orientation matrix were calculated from three sets of 36 frames. Data were collected with ω scan width of 0.5° at different settings of φ and 2θ with a frame time of 10 secs for 4q, while 7 secs for the 5d keeping the sample-to-detector distance fixed at 5.00 cm. The X-ray data collection was monitored by APEX2 program (Bruker, 2006). All the data were corrected for Lorentzian, polarization and absorption effects using SAINT and SADABS programs (Bruker, 2006). SHELX-97 was used for structure solution and full matrix least-squares refinement on $F^2$. All the hydrogen atoms were placed in geometrically idealized position and constrained to ride on their parent atoms. An ORTEP view of both compounds were drawn with 30% probability displacement ellipsoids and H atoms are shown as small spheres of arbitrary radii.

Crystal data of 4q C$_{21}$H$_{21}$N$_3$O$_3$, M = 363.41, colorless needle, 0.46x 0.20x 0.10 mm$^3$, monoclinic, space group $P2_1/c$, $a$ = 13.9952(17) Å, $b$ = 9.1123(12) Å, $c$ = 15.2436(19)Å, β = 97.909(9)°, $V$ = 1925.5(4)Å$^3$, $Z$ = 4, $T$ = 296(2) K, 2θ$_{\text{max}}$ = 50.00°, $D_{\text{calc}}$ (g cm$^{-3}$) = 1.254, $F(000)$ = 768, μ (mm$^{-1}$) = 0.085, 12212 reflections collected, 3344 unique reflections ($R_{\text{int}}$ = 0.1768), 2728 observed ($I > 2\sigma (I)$) reflections, multi-scan absorption correction, $T_{\text{min}}$ = 0.9618, $T_{\text{max}}$ = 0.9915, 246 refined parameters, $S$ = 1.187, $R1$ = 0.1164, wR2 = 0.1985 (all data $R$ = 0.1388, wR2 = 0.2103), maximum and minimum residual electron densities; $\Delta \rho_{\text{max}}$ = 0.326, $\Delta \rho_{\text{min}}$= -0.312 (eÅ$^{-3}$)

Crystal data of 5d C$_{22}$H$_{19}$N$_5$O, M = 369.42, colorless plate, 0.51x 0.43x 0.20mm$^3$, monoclinic, space group $P2_1/c$, $a$ = 12.3799(12) Å, $b$ = 13.0555(12) Å, $c$ = 11.5532(11)Å, β = 98.570(5)°, $V$ = 1846.4(3)Å$^3$, $Z$ = 4, $T$ = 296(2) K, 2θ$_{\text{max}}$ = 54.00°, $D_{\text{calc}}$ (g cm$^{-3}$) = 1.329, $F(000)$ = 776, μ (mm$^{-1}$) = 0.086, 19861 reflections collected, 4016 unique reflections ($R_{\text{int}}$ = 0.0516), 3086 observed ($I > 2\sigma (I)$) reflections, multi-scan absorption correction, $T_{\text{min}}$ = 0.9576, $T_{\text{max}}$ = 0.9831, 255 refined parameters, $S$ = 1.123, $R1$ = 0.0551, wR2 = 0.1569 (all data $R$ = 0.0700, wR2 = 0.1701), maximum and minimum residual electron densities; $\Delta \rho_{\text{max}}$ = 0.561, $\Delta \rho_{\text{min}}$= -0.299 (eÅ$^{-3}$).
