General procedure for the Sonogashira cross-coupling reaction:

A mixture of aryl halide (1 mmol), phenyl acetylene (1.5 mmol), K$_2$CO$_3$ (3 mmol) and CuI (0.08 mmol) was taken in round bottom flask. A suspension of Ni NPs-rGO (25 mg, 0.15 mmol Ni) N-methyl-2-pyrrolidone (5 mL) was added to it. The whole reaction mixture was stirred at 120 °C for 4 h. After completion of the reaction (monitored by TLC), the catalyst was separated from the reaction mixture by using an external magnet and the reaction mixture was poured into water. The organic product was recovered by extracting with ethyl acetate (3x10 mL). Then the organic phase were dried over Na$_2$SO$_4$ and concentrated in vacuum. The products were purified by column chromatography using silica gel (60-120 mesh) with EtOAc/hexanes as eluent to obtain the desired Sonogashira cross-coupling product.
