Figure S1: FTIR spectrum of hydrothermally prepared spherical carbon template

**Description:** The formation of the carbon spheres involves the dehydration and subsequent carbonization of dextrose. Due to non- or just partially dehydrated dextrose, the surface of the spheres contains OH and C=O groups.\(^1\) As shown in the Figure, the broad band at 3500-3650 cm\(^{-1}\) is attributed to O-H (hydroxyl) vibration. The band at 2924 cm\(^{-1}\) is due to asymmetric C-H stretching of aliphatic groups. C–OH stretching and bending vibration are observed at 1000-1300 cm\(^{-1}\). The bands at 1,704 and 1,618 cm\(^{-1}\) are attributed to C=O vibration and in-plane C=C stretching vibration of aromatic ring respectively.\(^{1,2}\)

Figure S2: (a) Point scanning on ZnO nano-tips and (b) corresponding EDS spectrum; inset table summarizes the weight and atomic % of Zn and O obtained from EDS spectrum of ZnO nano-tips (c) Point scanning on ZnO micro-rod and (d) corresponding EDS spectrum; inset table summarizes the weight and atomic % of Zn and O obtained from EDS spectrum of ZnO micro-rod.

Description: The compositions of the nano-tips as well as micro-rod are separately studied using the energy dispersive X-ray spectroscopy (EDS) facility associated with the FESEM instrument. Compositional analyses using point scanning mode exhibit that the zinc (Zn) and oxygen (O) ratio is higher for micro-rod than nano-tips which further supports that the crystallinity of the micro-rod is better than the nano-tips.
**Figure S3:** N$_2$ adsorption-desorption isotherms of (a) A-I and (b) A-II derived ZnO products

**Description:** The surface area of the products derived from A-I and A-II are estimated from the N$_2$ adsorption-desorption isotherm shown in the figure. The estimated surface area of product derived from A-II (7.2 m$^2$ g$^{-1}$) is found considerably higher than the product derived from A-I (3.9 m$^2$ g$^{-1}$).
**Description:** Figure S4 represents the X-ray diffraction pattern of ZnO hierarchical structure. The XRD pattern is in good agreement with the JCPDS Card No. 03-0888. The XRD pattern recorded under CoKa radiation (PW 3040/60, Panalytical, Netherland).
