Figure S1: (a) Electronic band structure of \textit{Pnma}-phase of SnSe. Fermi level is indicated by $E_F$. The crystal structure used to carry out DFT calculations is orthorhombic. The top of valence and lies along Z – $\Gamma$ direction while bottom of conduction band is located at $\Gamma$ point yielding an indirect band gap of 0.74 eV. (b) Partial density of states for \textit{Pnma}-phase of SnSe.
Figure S2: Band gap calculation of SnSe (*Pnma*) from UV absorption spectra.

Figure S3: Temperature dependence of thermoelectric compatibility factor of as-synthesized p-type SnSe.
