1. General experimental information

Reagents and solvents: Commercially available reagents were used without any further purification. All organic solvents were also of reagent grade quality without any further purification.

Chromatography: Flash column chromatography was performed using silica gel (200-300 mesh).

Analytical thin-layer chromatography (TLC) was performed on 0.2 mm coated silica gel plates (HSGF 254) and visualized using a UV lamp (254 nm or 365 nm).

Nuclear Magnetic Resonance Spectroscopy:

$^1$H NMR was recorded on magnet system 400’54 ascend purchased from Bruker Biospin AG. $^1$H NMR spectra chemical shifts (δ) are reported in parts per million (ppm) referenced to TMS (0 ppm). Data are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, dd = doublet of doublets, dt = doublet of triplets, ddt = doublet of doublet of triplets, dtd = doublet of triplet of doublets, m = multiplet, br = broad), coupling constant (J) in Hertz (Hz), and integration.

$^{13}$C NMR spectra chemical shifts (δ) are reported in parts per million (ppm) were referenced to carbon resonances in the NMR solvent (CDCl$_3$, δ = 77.23 ppm).

ESI-MS spectra were recorded on Agilent Q-TOF 6520.

2. General material information for continuous-flow setups

Parts information for continuous-flow system:

(1), Slit plate mixer LH25 (Hastelloy C) purchased from Ehrfeld Mikrotechnik BTS GmbH.

(2), The coil reactors and connecting tubes are PFA tubes purchased from Upchurch Scientific.

(3), Syringe pumps were purchased from Harvard Apparatus.

As shown in Figure S1, the PFA tubing reactor (ID=0.05 cm, length=1000 cm, volume=1.962 mL) was connected to two syringes respectively via the slit plate mixer. The syringe pumps were used to infuse the liquid reagent into the mixer and the reactor. The modest temperature was kept by the oil bath.

3. experimental details of a, b, c, d, e in table 1

3.1 experimental details of a in table 1
The reaction was carried out using a 25 mL round bottom flask charged with DL-1-phenethylalcohol (1 mmol, 0.1221 g, 1 eq), 1-oxa-4-azacyclohexane (3 mmol, 0.2614 g, 3 eq), potassium iodide (0.2 mmol, 0.0332 g, 0.2 eq), sulfuric acid (98%, 0.2 mmol, 0.0200 g, 0.2 eq), hydrogen peroxide (30% aq, 6 mmol, 0.6802 g, 6 eq), DMF (3 mL) and a magnetic stir bar. The reaction mixture was stirred at 70°C for 24 h.

3.2 experimental details of b in table 1
The reaction was carried out using a 25 mL round bottom flask charged with DL-1-phenethylalcohol (1 mmol, 0.1221 g, 1 eq), 1-oxa-4-azacyclohexane (3 mmol, 0.2614 g, 3 eq), potassium iodide (0.2 mmol, 0.0332 g, 0.2 eq), sulfuric acid (98%, 0.2 mmol, 0.0200 g, 0.2 eq), DMF (3 mL) and a magnetic stir bar. Then a solution of hydrogen peroxide (H₂O₂ (30% aq, 6 mmol, 0.6802 g, 6 eq) in DMF (1.5 mL)) was added into the reaction mixture slowly with the help of springe pump within 12 h. The mixture was stirred for another 12 h.

3.3 Experimental details of c in table 1.
A solution of DL-1-phenethylalcohol (1 mmol, 0.1221 g, 1 eq), potassium iodide (0.2 mmol, 0.0332 g, 0.2 eq), sulfuric acid (98%, 0.2 mmol, 0.0200 g, 0.2 eq) and hydrogen peroxide (2 mmol, 0.2267 g, 2 eq) in DMF (1.5 mL) was stirred at 70°C. After 12 h, 1-oxa-4-azacyclohexane (3 mmol, 0.2614 g, 3 eq) was added in a whole. Then, the hydrogen peroxide (a solution of H₂O₂ (30% aq, 4 mmol, 0.4535 g, 4 eq) in DMF (1.5 mL) was syringed addition within 2 h. The mixture was stirred for another 1 h.

3.4 Experimental details of d in table 1.
One vial was placed a 15 mL DMF solution of the DL-1-phenethylalcohol (10 mmol, 1.2207 g, 1 eq) and 1-oxa-4-azacyclohexane (30 mmol, 2.6136 g, 3 eq). Another vial was placed a 14.5 mL DMF solution of hydrogen peroxide (30% aq, 60 mmol, 6.8020 g, 6 eq), sulphuric acid (98%, 2 mmol, 0.2001 g, 0.2 eq) and potassium iodide (2 mmol, 0.3320 g, 0.2 eq). 0.5 mL H₂O was added to dissolve the potassium iodide. The reaction streams were introduced to the PFA tube reactor at a preheated temperature of 70°C through the mixer. The flow rates of reagent and oxidant were both 0.327 mL/min (residence time was 3 min). The reaction mixture was collected in a vial through the segment of PTA tube.

3.5 Experimental details of e in table 1.
One vial was placed a 15 mL DMF solution of the DL-1-phenethylalcohol (10 mmol, 1.2207 g, 1 eq). Another vial was placed a 14.5 mL DMF solution of hydrogen peroxide (30% aq, 20 mmol, 2.2673 g, 2 eq), sulphuric acid (98%, 2 mmol, 0.2001 g, 0.2 eq) and potassium iodide (2 mmol, 0.3320 g, 0.2 eq). 0.5 mL H₂O was added to dissolve the potassium iodide. The reaction streams were introduced to the PFA tube reactor at a preheated temperature of 70°C through the mixer. The flow rates of reagent and oxidant were both 0.327 mL/min (residence time was 3 min). The reaction mixture was collected in a vial through the segment of PTA tube. 3 mL reaction mixture was taken and 1-oxa-4-azacyclohexane (3 mmol, 0.2614 g, 3 eq) was added in a whole. Then, the hydrogen peroxide (a solution of H₂O₂ (30%
aq, 4 mmol, 0.4535 g, 4 eq) in DMF (1.5 mL) was added slowly within 2h using springe pump. The mixture was stirred for another 1h.

8. General experimental details for the synthesis of α-ketoamides

One vial was placed a 15 mL DMF solution of the specific benzylic alcohol (10 mmol, 1 eq). Another vial was placed a 14.5 mL DMF solution of hydrogen peroxide (30\% aq, 20 mmol, 2.2673 g, 2 eq), sulphuric acid (98\%, 0.5 mmol, 0.0500 g, 0.05 eq) and potassium iodide (0.5 mmol, 0.0830 g, 0.05 eq). 0.5 mL H\(_2\)O was added to dissolve the potassium iodide. The reaction streams were introduced to the PFA tube reactor at a preheated temperature of 60\(^\circ\text{C}\) through the mixer. The flow rates of reagent and oxidant were both 0.327 mL/min (residence time was 3 min). The reaction mixture was collected in a vial through the segment of PTA tube. 3 mL reaction mixture was taken and amine (3 mmol, 3 eq) was added in a whole. Then, the hydrogen peroxide (a solution of H\(_2\)O\(_2\) (30\% aq, 3.6 mmol, 0.4081 g in DMF (1.5 mL)) was added slowly within 2h using springe pump. After the TLC revealed that
the full conversion of starting material was consumed, the reaction mixture was cooled and
diluted with ethyl acetate (30 mL). The crude product was washed with brine (30 mL) and
water (30 mL). The separated organic layer was dried over by anhydrous Na₂SO₄ and
filtered. The filtrate was concentrated under reduced pressure and the residue was
chromatographed on silica gel using hexane/ethyl acetate to afford the desired product.

10. Proposed mechanism

Initially, I⁻ was oxidized to form the hydroiodic acid in the presence of acid and hydrogen peroxide. The generated hydroiodic acid subsequently reacted with the corresponding hydroxyl group to form the hypoiodite intermediate 1, which yielded the corresponding carbonyl compounds via α-hydrogen elimination. Brønsted acid and I⁻ were reformatted to maintain the system circularly.

As listed in figure S2, the oxidative amidation of acetophenones was likely to undergo the processes of iodination (A-B), nucleophilic substitution by amine (B-C), iodination (C-D), ionization (D-E), hydrolysis (E-F) and oxidation (F-G).

One vial was placed a 15 mL DMF solution of DL-1-phenethylalcohol (10 mmol, 1 eq). Another vial was placed a 14.5 mL DMF solution of hydrogen peroxide (30%, 20 mmol, 2 eq), sulphuric acid (98%, 0.5 mmol, 0.05 eq) and potassium iodide (0.5 mmol, 0.05 eq). 0.5 mL H₂O was added to dissolve the potassium iodide. The reaction streams were introduced to the PFA tube reactor at a preheated temperature of 60°C through the mixer. The flow rates of reagent and oxidant were both 0.327 mL/min (residence time was 3 min). The reaction mixture was collected in a vial through the segment of PTA tube. 3 mL reaction mixture was taken and 1-methylpiperazine (3 mmol, 3 eq) was added in a whole. Then, the hydrogen peroxide (a solution of H₂O₂ (3.6 mmol) in DMF (1.5 mL)) was added slowly within 2h using springe pump. After the TLC revealed that the full conversion of staring material was completed, the reaction mixture was cooled and diluted with dichloromethane (30mL). The crude product was washed with brine (30mL) and water (30mL). The separated organic layer was dried over by anhydrous Na₂SO₄ and filtered. The filtrate was concentrated under reduced pressure and the residue was chromatographed on silica gel using hexane/ethyl acetate/triethylamine to afford the desired product.
