1. General Reagent Information

Commercial reagents were purchased from J&K, Energy, Sigma-Aldrich, Alfa Aesar, Acros Organics, Strem Chemicals, TCI and used as received or purified according to Purification of Common Laboratory Chemicals. MeCN, MeOH and Acetone were purchased from Acros Organics and used directly without further purification. Distilled water was degassed with sonication under vacuum and then backfilled with argon.

2. General Analytical Information

NMR spectra were measured on a Bruker Avance-400 spectrometer and chemical shifts (δ) are reported in parts per million (ppm). $^1$H NMR spectra were recorded at 400 MHz in NMR solvents (CDCl$_3$, Acetone-d$_6$, DMSO-d$_6$) and referenced internally to corresponding solvent resonance, and $^{13}$C NMR spectra were recorded at 100 MHz and referenced to corresponding solvent resonance, Carbons bearing boron substituents were generally not observed due to quadrupolar relaxation. $^{11}$B NMR spectra were collected on at 128.4 MHz. $^{19}$F NMR spectra were collected on at 376.5 MHz. Coupling constants are reported in Hz with multiplicities denoted as s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet) and br (broad). Infrared spectra were collected on a Thermo Fisher Nicolet 6700 FT-IR spectrometer using ATR (Attenuated Total Reflectance) method. Absorption maxima (ν max) are reported in wavenumbers (cm$^{-1}$). Melting points were determined with MP300, a laboratory Devices Inc, chinese instrument, and are uncorrected. High resolution mass spectra (HRMS) were obtained on a Bruker Apex IV FTMS spectrometer or an Agilent 6224 LC/MS TOF spectrometer.

3. General Information for Continuous Flow Setup

General Material Information

The equipment configuration that was used for the borylation reaction is depicted in Figures S1 and S2. The dual channels syringe pump (LSP02-1B) was purchased from Baoding Longer Precision Pump Company, which are suitable for high accuracy and small flow rate liquid transferring. The equipped devices (such as: quartz immersion well, 300 W high-pressure mercury lamp and accompanying power supply etc.) were part of the photochemistry instrument XPA-7 (Figures S1) which was purchased from Xujiang electromechanical plant (Nanjing, China). The transparent fluorinated ethylene propylene (FEP) tubing, fluidic connections and the back-pressure regulator were purchased from IDEX Health and Science, formerly Upchurch Scientific. The cooling liquid circulating pump (DLSB-5/10) was purchased from Zhengzhou Changcheng Scientific Industrial and Trade Co. Ltd. The E-series flow chemistry reaction system was a product of Vapourtec, UK.
General setup for the continuous-flow reactor (Figure S2)

A 300 W high-pressure mercury lamp is positioned in the center of a jacketed quartz immersion well using the cooling liquid circulating pump to regulate the reaction temperature. One layer of the transparent fluorinated ethylene propylene (FEP) tubing 1.0 m (1.6 mm OD; 1.0 mm ID; the internal volume 0.78 mL) is wound around the central part of the immersion well, and both ends of the tubing are extended with another 0.5 m FEP tubing. The rest part of the quartz immersion well was covered with aluminum foil. The reaction mixture is introduced into the tubing using a syringe pump at controlled flow rates and collected into a cylinder after passing through a 5-psi back pressure regulator.

(Note: the UV lamp was safely placed in a box to prevent any possible injury.)
General setup for the gram-scale continuous-flow reactor

A 300 W high-pressure mercury lamp is positioned in the center of a jacketed quartz immersion well using the cooling liquid circulating pump to regulate the reaction temperature. One layer of the transparent fluorinated ethylene propylene (FEP) tubing 10.0 m (1.6 mm OD; 1.0 mm ID; the internal volume 7.8 mL) is wound around the central part of the immersion well, and both ends of the tubing are extended with another 0.5 m FEP tubing. The rest part of the quartz immersion well was covered with aluminum foil. The reaction mixture is introduced into the tubing using the Vapourtec E-series flow chemistry reactor under a 5-psi pressure at controlled flow rates and finally into the collector.

[4.2 Studies of the decomposition of B$_{2}$pin$_{2}$](#)

In order to reduce the amount of B$_{2}$pin$_{2}$ needed, we investigated the decomposition of B$_{2}$pin$_{2}$ under different reaction conditions and checked the results by $^{11}$B NMR. We found that although a solution of B$_{2}$pin$_{2}$ in MeCN/water/acetone itself did not decompose (not shown), heating this mixture, addition of TMDAM or applying UV irradiation led to the formation of a new peak on $^{11}$B NMR. The detailed results are shown in Figure S4. Using methanol-d$_{4}$ as the solvent, we knew that the decomposition product was not B$_{2}$(OH)$_{4}$ (Figure S5).

Yields based on 1H NMR analysis of the crude products with 1,3,5-trimethoxybenzene added as an internal standard.

5. Typical Experimental Procedures

A) Typical batch procedure of the metal-free borylation using the set-up in Figure S1

A solution of the aryl iodide (0.1-0.2 mmol), B_2(pin)_2/B_2(OH)_2 (0.1-0.4 mmol), TMDAM (if needed, 14 μL, 0.5 eq), acetone (if needed, 0.2 mL) and the additive reagents in MeCN/MeOH and H_2O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then the internal standard 1,3,5-trimethoxybenzene (0.1-0.2 mmol) was added into the crude product mixture for the 1HNMR yield study. Or through the usual workup and column chromatography produced the target boronate.

B) Typical procedure for the synthesis of boronate esters in flow using the set-up in Figure S2

An oven-dried screwcapping volumetric flask (10.0 mL) was charged with aryl halide 3 (1.0 mmol, if solid, 1.0 eq) and B_2(pin)_2 (1.5 mmol, 1.5 eq) then capped with a septum. The vessel was evacuated and back-filled with argon (this process was carried out a total of 3 times). 3 (1.0 mmol, if liquid, 1 eq), TMDAM (70 μL, 0.5 eq) acetone (0.9 mL) and H_2O (1.8 mL) were added by syringes and MeCN was added to dissolve the solids and filled up to volume. Before reaction all the solutions were prepared under argon atmosphere and the reactors tubing were purged with MeCN three times at least. After that, all reactors and connecting tubings were filled with MeCN. A 10 mL disposable syringe was used to pump the reaction solution through the continuous-flow reactor at controlled flow rates. A cooling liquid circulating pump is used to maintain the temperature around the tubing is -5 °C. After reaching steady state, a sample of the reaction mixture was collected which contained theoretical yield of 0.3 mmol based on flow rate and collecting time. The mixture was concentrated and usual workup and column chromatography produced the target boronate.

\[
\text{2-(4-methoxyphenyl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (3a).}
\]
[1] Following the general procedure for batch metal-free borylation using the set-up in Figure S1, a solution of the 1-iodo-4-methoxybenzene (46.8 mg, 0.2 mmol), B_2pin_2 (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.1 mmol), acetone (0.2 mL) and the additive reagents in MeCN/H_2O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE 1:50) to get the product 3a (34.2 mg, 73%) as a pale yellow liquid.

[2] Following the general continuous metal-free borylation procedure using the set-up in Figure S2, syringe was loaded with a solution of 1-iodo-4-methoxybenzene (234.0 mg, 1.0 mmol), B_2pin_2 (381.0 mg, 1.5 mmol), and TMDAM (70 μL, 0.5 mmol) in 10.0 mL volume. The flow rate was 52 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 58 min (3.0 mL, 0.3 mmol). Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE 1:50) to get the product 3a (59.0 mg, 84%) as a pale yellow liquid. Spectroscopical data in accordance with the literature.[11] ^1H NMR (400 MHz, CDCl₃): δ ppm 7.76 (d, J = 8.4 Hz, 2H), 6.91 (d, J = 8.8 Hz, 2H), 3.83 (s, 3H), 1.33 (s, 12H). ^13C NMR (100 MHz, CDCl₃): δ ppm 162.3, 137.0, 113.4, 83.5, 55.2, 25.0. Carbon bearing boron not observed. IR (neat, cm⁻¹): 2978, 1605, 1360, 1143, 1091, 1030.

4,4,5,5-tetramethyl-2-phenyl-1,3,2-dioxaborolane (3b).

[1] Following the general continuous-flow borylation procedure using the set-up in Figure S2, the syringe was loaded with a solution of iodobenzene (204.0 mg, 1.0 mmol), B_2pin_2 (381.0 mg, 1.5 mmol), and TMDAM (70 μL, 0.5 mmol) in 10.0 mL volume. The flow rate was 52 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 58 min (3.0 mL, 0.3 mmol). Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (PE) to get the product 3b (54.5 mg, 89%) as a pale yellow liquid.

[2] The grams scale borylation of iodobenzene using the continuous-flow set-up in Figure S3, Vapourtec E-series flow chemistry reactor was loaded with a solution of iodobenzene (2.04 g, 10.0 mmol), B_2pin_2 (3.81 g, 15.0 mmol), TMDAM (700 μL, 5 mmol) in 100.0 mL MeCN/H_2O = 4/1 and acetone. The flow rate was 520 μL/min. After steady state, a sample solution was collected into the collector for 154 min (80.0 mL, 8.0 mmol). Then the mixture was concentrated in vacuo and extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate,
filtered and concentrated in vacuo then purified by column chromatography (PE) to get the product 3b (1.47 g, 90%) as a pale yellow liquid. Spectroscopical data was in accordance with the literature.[2] $^1$H NMR (400 MHz, CDCl$_3$): δ ppm 7.81 (d, $J$ = 7.6 Hz, 2H), 7.48 (t, $J$ = 7.4 Hz, 1H), 7.38 (t, $J$ = 7.4 Hz, 2H), 1.35 (s, 12H). $^{13}$C NMR (100 MHz, CDCl$_3$): δ ppm 134.7, 131.2, 127.6, 83.7, 24.5. Carbon bearing boron not observed. IR (neat, cm$^{-1}$): 2959, 2359, 1734, 1361, 1261, 1092, 1020.

4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenol (3c).

[1] Following the general procedure for batch metal-free borylation using the set-up in Figure S1, a solution of the 4-iodophenol (44.0 mg, 0.2 mmol), B$_3$pin$_2$ (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H$_2$O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE 1:50→EA/PE 1:10) to get the product 3c (35.6 mg, 81%) as a white solid.

[2] Following the general continuous metal-free borylation procedure using the set-up in Figure S2, syringe was loaded with a solution of 4-bromophenol (173.0 mg, 1.0 mmol), B$_3$pin$_2$ (381.0 mg, 1.5 mmol), and TMDAM (70 μL, 0.5 mmol) in 10.0 mL volume. The flow rate was 26 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 116 min (3.0 mL, 0.3 mmol). Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE 1:50→EA/PE 1:10) to get the product 3c (46.8 mg, 71%) as a white solid.

[3] The grams scale borylation of 4-iodophenol using the continuous-flow set-up in Figure S3. Vapourtec E-series flow chemistry reactor was loaded with a solution of 4-iodophenol (2.20 g, 10.0 mmol), B$_3$pin$_2$ (3.81 g, 15.0 mmol), TMDAM (700 μL, 5 mmol) in 100.0 mL MeCN/H$_2$O = 4/1 and acetone. The flow rate was 520 μL/min. After steady state, a sample solution was collected into the collector for 154 min (80.0 mL, 8.0 mmol). Then the mixture was concentrated in vacuo and extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE 1:50→EA/PE 1:10) to get the product 3c (1.63 g, 93%) as a white solid. Mp 108 - 110 °C. Spectroscopical data was in accordance with the literature.[3] $^1$H NMR (400 MHz, CDCl$_3$): δ ppm 7.71 (d, $J$ = 7.6 Hz, 2H), 6.82 (d, $J$ = 7.2 Hz, 2H), 5.14 (s, 1H), 1.33 (s, 12H). $^{13}$C NMR (100 MHz, CDCl$_3$): δ ppm 158.1, 137.2, 114.8, 83.6, 24.7. Carbon bearing boron not observed. IR (neat, cm$^{-1}$): 3367, 2979, 1608, 1360, 1143, 1087.
Following the general procedure for batch metal-free borylation using the set-up in **Figure S1**, a solution of the 4-iodoaniline (43.8 mg, 0.2 mmol), B$_2$pin$_2$ (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H$_2$O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE 1:50→EA/PE 1:5) to get the product 3d (34.2 mg, 78%) as a white solid. Mp134 - 136 °C. Spectroscopical data in accordance with the literature.\[3\]$^1$H NMR (400 MHz, CDCl$_3$): δ ppm 7.62(d, $J$ = 7.6 Hz, 2H), 6.66 (d, $J$ = 8.0 Hz, 2H), 3.82 (s, 2H), 1.32 (s, 12H).

Following the general procedure for batch metal-free borylation using the set-up in **Figure S1**, syringe was loaded with a solution of N-(4-iodophenyl)acetamide (52.2 mg, 0.2 mmol), B$_2$pin$_2$ (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H$_2$O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE 1:2) to get the product 3e (47.0 mg, 90%) as a white solid. Mp188 - 190 °C. Spectroscopical data in accordance with the literature.\[4\]$^1$H NMR (400 MHz, CDCl$_3$): δ ppm 7.77 (d, $J$ = 8.4 Hz, 2H), 7.51 (d, $J$ = 8.0 Hz, 2H), 2.18 (s, 3H), 1.33 (s, 12H). $^{13}$C NMR (100 MHz, CDCl$_3$): δ ppm 194.2, 136.5, 114.1, 83.3, 25.0. Carbon bearing boron not observed. IR (neat, cm$^{-1}$): 3450, 2977, 1603, 1360, 1143, 1087.

Following the general procedure for batch metal-free borylation using the set-up in **Figure S1**, syringe was loaded with a solution of N-(4-iodophenyl)acetamide (52.2 mg, 0.2 mmol), B$_2$pin$_2$ (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H$_2$O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE 1:2) to get the product 3e (47.0 mg, 90%) as a white solid. Mp188 - 190 °C. Spectroscopical data in accordance with the literature.\[4\]$^1$H NMR (400 MHz, CDCl$_3$): δ ppm 7.77 (d, $J$ = 8.4 Hz, 2H), 7.51 (d, $J$ = 8.0 Hz, 2H), 7.24 (s, 1H), 2.18 (s, 3H), 1.33 (s, 12H). $^{13}$C NMR (100 MHz, CDCl$_3$): δ ppm 168.2, 140.5, 135.8, 118.5, 83.7, 29.7, 24.8. 1,4-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)benzene (3q)

Following the general procedure for batch metal-free borylation using the set-up in Figure S1, a solution of the p-B(pin) iodobenzene (66.0 mg, 0.2 mmol), B₂pin₂ (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H₂O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE 1:100) to get the product 3q (40.3 mg, 61%) as a white solid. Mp: 236 - 238 °C. Spectroscopical data in accordance with the literature.¹ H NMR (400 MHz, CDCl₃): δ ppm 7.80 (s, 4H), 1.35 (s, 12H).¹³C NMR (100 MHz, CDCl₃): δ ppm 134.0, 83.8, 24.8. Carbon bearing boron not observed. IR (neat, cm⁻¹): 2976, 2926, 1739, 1522, 1355, 1257, 1142, 1101.

2-(4-(allyloxy)phenyl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (3r)

Following the general continuous metal-free borylation procedure using the set-up in Figure S2, syringe was loaded with a solution of 1-(allyloxy)-4-iodobenzene (260.1 mg, 1.0 mmol), B₂pin₂
(381.0 mg, 1.5 mmol), and TMDAM (70 μL, 0.5 mmol) in 10.0 mL volume. The flow rate was 52 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 58 min (3.0 mL, 0.3 mmol). Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (PE/EA=100/1) to get the product 3r (49.9 mg, 64%) as a pale yellow liquid. Spectroscopical data in accordance with the literature.

5-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)pyridin-2-amine (3s)

[1] Following the general procedure for batch metal-free borylation using the set-up in Figure S1, a solution of the 5-iodopyridin-2-amine (44.0 mg, 0.2 mmol), B\(_2\)pin\(_2\) (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H\(_2\)O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The H NMR yield determined by \(^1\)H NMR with 1,3,5-trimethoxybenzene as an internal standard (3s, 40%).

[2] Following the general continuous metal-free borylation procedure using the set-up in Figure S2, syringe was loaded with a solution of 5-iodopyridin-2-amine (220.0 mg, 1.0 mmol), B\(_2\)pin\(_2\) (381.0 mg, 1.5 mmol), and TMDAM (70 μL, 0.5 mmol) in 10.0 mL volume. The flow rate was 52 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 58 min (3.0 mL, 0.3 mmol). Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo. The H NMR yield determined by \(^1\)H NMR with 1,3,5-trimethoxybenzene as an internal standard (3s, 50%).
[3] Subsequent Pd-catalyzed SMC reactions:

(In order to prove the compound 3s was obtained)

Following the general procedure for batch metal-free borylation using the set-up in Figure S1, a solution of the 5-iodopyridin-2-amine (44.0 mg, 0.2 mmol), B₂pin₂ (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H₂O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4 h. And then the solvent was removed under reduced pressure. Pd(PPh₃)₄ (5 mol%) and K₂CO₃ (0.4 mmol, 2eq) were loaded into a Schlenk tube equipped with a Teflon-coated magnetic bar. The tube was evacuated and back-filled with argon for three times. Pre-complexation was accomplished by adding 2.0 mL DMF, 4-iodoanisole (0.4 mmol, 2eq) into the above crude arylboronate product into the Schlenk tube and the solution was stirred and heated at 90 °C overnight. After completion of the reaction, the reaction tube was allowed to cool to room temperature, and the solution was filtered through a short column of silica gel and washed with EtOAc (~20 mL). The filtrate was concentrated and purified by flash column chromatography on silica gel to afford the final product 3ss (18.0 mg, 45%). Spectroscopical data in accordance with the literature. [13] ¹H NMR (400 MHz, CDC13): δ ppm 8.25 (s, 1H), 7.63 (d, J = 8.4 Hz, 1H), 7.42 (d, J = 8.4 Hz, 2H), 6.97 (d, J = 8.4 Hz, 2H), 6.58 (d, J = 8.4 Hz, 1H), 4.34 (s, 2H), 3.83 (s, 3H).
Following the general continuous metal-free borylation procedure using the set-up in Figure S2, syringe was loaded with a solution of methyl 4-bromobenzoate (215.0 mg, 1.0 mmol), B₂pin₂ (381.0 mg, 1.5 mmol), and TMDAM (70 μL, 0.5 mmol) in 10.0 mL volume. The flow rate was 52 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 58 min (3.0 mL, 0.3 mmol). Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (PE/EA=20/1) to get the product 3t (73.1 mg, 93%) as a white solid. Mp: 75 - 77 °C. Spectroscopical data in accordance with the literature. [7]

2-(4-chlorophenyl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (3u)

[1] Following the general procedure for batch metal-free borylation using the set-up in Figure S1, a solution of the 1-bromo-4-chlorobenzene (38.3 mg, 0.2 mmol), B₂pin₂ (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H₂O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE = 1:100) to get the product 3u (26.7 mg, 56%) as a pale yellow liquid.

[2] Following the general continuous metal-free borylation procedure using the set-up in Figure S2, syringe was loaded with a solution of 1-bromo-4-chlorobenzene (191.0 mg, 1.0 mmol), B₂pin₂ (381.0 mg, 1.5 mmol), and TMDAM (70 μL, 0.5 mmol) in 10.0 mL volume. The flow rate was 26 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 116 min (3.0 mL, 0.3 mmol). Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE = 1:100) to get the product 3u (41.5 mg, 58%) as a pale yellow liquid, Spectroscopical data in accordance with the literature. 2-(benzo[d][1,3]dioxol-5-yl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (3w)

[1] Following the general procedure for batch metal-free borylation using the set-up in Figure S1, a solution of the 5-bromobenzo[d][1,3]dioxole (40.2 mg, 0.2 mmol), B$_2$pin$_2$ (101.6 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H$_2$O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then
purified by column chromatography (EA/PE = 1:100) to get the product 3w (26.7 mg, 15%) as a pale yellow liquid.

[2] Following the general continuous metal-free borylation procedure using the set-up in Figure S2, syringe was loaded with a solution of 5-bromobenzo[d][1,3]dioxole (201.0 mg, 1.0 mmol), B$_2$pin$_2$ (381.0 mg, 1.5 mmol), and TMDAM (70 μL, 0.5 mmol) in 10.0 mL volume. The flow rate was 26 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 116 min (3.0 mL, 0.3 mmol). Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE = 1:100) to get the product 3w (41.7 mg, 56%) as a pale yellow liquid, Spectroscopical data in accordance with the literature.

N,N-dimethyl-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)aniline (3x)

Following the general continuous metal-free borylation procedure using the set-up in Figure S2, syringe was loaded with a solution of 4-bromo-N,N-dimethylaniline (200.0 mg, 1.0 mmol), B$_2$pin$_2$ (381.0 mg, 1.5 mmol), and TMDAM (70 μL, 0.5 mmol) in 10.0 mL volume. The flow rate was 26 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 116 min (3.0 mL, 0.3 mmol). Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE = 1:100) to get the product 3x (27.4 mg, 37%) as a white solid, Spectroscopical data in accordance with the literature.

4-(5,5-dimethyl-1,3,2-dioxaborinan-2-yl)phenol (3y)

Following the general procedure for batch metal-free borylation using the set-up in Figure S3, a solution of the 4-iodophenol (44.0 mg, 0.2 mmol), B$_2$neop$_2$ (90.3 mg, 0.4 mmol), TMDAM (14 μL, 0.5 eq), acetone (0.2 mL) and the additive reagents in MeCN/H$_2$O (4/1 v/v, 2.0 mL) was added into a quartz test tube containing a magnetic stirring bar and the mixture was purged with argon for 10 min. The tube was then capped with a septum. The reaction mixture was irradiated using a 300 W high-pressure mercury lamp through a water-cooled quartz immersion well for 4h. Then 0.5 mL brine was added, the mixture was extracted with ethyl acetate. The combined organic layer were dried with sodium sulfate, filtered and concentrated in vacuo then purified by column chromatography (EA/PE = 1:100) to get the product 3y (26.7 mg, 15%) as a pale yellow liquid.

C) Typical procedure for the synthesis of trifluoroborates

An oven-dried screwcapping volumetric flask (10.0 mL) was charged with aryl halide 3 (1.0 mmol, if solid, 1 eq) and B\(_2\)(OH)\(_4\) (1.5 mmol, 1.5 eq) then capped with a septum. The vessel was evacuated and back-filled with argon (this process was carried out a total of 3 times). 3 (1.0 mmol, if liquid, 1 eq), H\(_2\)O (2.0 mL) were added by syringes and MeOH was added to dissolve the solids and filled up to volume. Before reaction all the solutions were prepared under argon atmosphere and the reactors tubing were purged with MeOH three times at least. After that, all reactors and connecting tubings were filled with MeOH. A 10 mL disposable syringe was used to pump the reaction solution through the continuous-flow reactor (the set-up in Figure S2) at controlled flow rates. A cooling liquid circulating pump is used to maintain the temperature around the tubing is -5 °C. After reaching steady state, a sample of the reaction mixture was collected which contained theoretical yield of 0.8 mmol based on flow rate and collecting time. The crude reaction was cooled to 0 °C and 6.5 equivalents of a 4.5 M aqueous KHF\(_2\) (2.8 mmol) solution was added. The reaction was stirred for 10 min at 0 °C before removing the bath and allowing the mixture to stir at rt until the conversion to the corresponding trifluoroborate was achieved as determined by 11B NMR. After conversion, the mixture was concentrated and further dried under high vacuum Soxhlet extraction with acetone (50 mL) for 12 hours. The collected solvent was concentrated and then dissolved in a minimal volume of acetone (~ 2 mL). The addition of Et\(_2\)O (~30 mL) led to the precipitation of the desired product. At last, the product was collected by filtration and washed with Et\(_2\)O (2*10 mL).
Potassium (4-Methoxyphenyl) trifluoroborate (8a)

Following the general procedure C, syringe was loaded with a solution of 1-iodo-4-methoxybenzene (234.0 mg, 1.0 mmol), B$_2$(OH)$_2$ (134.4 mg, 1.5 mmol), in 10.0 mL volume (MeOH/H$_2$O = 4/1). The flow rate was 78 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 102.6 min (8.0 mL, 0.8 mmol). The crude reaction was moved to a 25 mL round bottom flask and cooled to 0 °C, then KHF$_2$ was added (1.2 mL of a 4.5 M aqueous solution, 6.5 equiv). The title compound was obtained as a white solid in 93% yield (159.2 mg). Mp: > 250 °C. Spectral data were in accordance with those published. $^{[11]}$ $^1$H NMR (400 MHz, DMSO-$d_6$) δ 7.22 (d, $J = 7.2$ Hz, 2H), 6.66 (d, $J = 7.6$ Hz, 2H), 3.66 (s, 3H). $^{13}$C NMR (100 MHz, DMSO-$d_6$) δ 157.2, 132.2, 111.8, 54.4. $^{11}$B NMR (128 MHz, DMSO-$d_6$) δ 2.76. $^{19}$F NMR (376 MHz, DMSO-$d_6$) δ -138.2. IR (neat, cm$^{-1}$): 3016, 2955, 2837, 1918, 1605, 1281, 1178, 1032.

Potassium O-Tolytrifluoroborate (8b)

Following the general procedure C, syringe was loaded with a solution of 1-iodo-2-methylbenzene (218.0 mg, 1.0 mmol), B$_2$(OH)$_2$ (134.4 mg, 1.5 mmol), in 10.0 mL volume (MeOH/H$_2$O = 4/1). The flow rate was 78 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 102.6 min (8.0 mL, 0.8 mmol). The crude reaction was moved to a 25 mL round bottom flask and cooled to 0 °C, then KHF$_2$ was added (1.2 mL of a 4.5 M aqueous solution, 6.5 equiv). The title compound was obtained as a white solid in 85% yield (134.7 mg). Mp: 227 - 229 °C. Spectral data were in accordance with those published. $^{[11]}$ $^1$H NMR (400 MHz, acetone-$d_6$) δ 7.47 (d, $J = 5.6$ Hz, 1H), 6.89 (s, 3H), 2.38 (s, 3H). $^{13}$C NMR (100 MHz, acetone-$d_6$) δ 141.9, 132.8, 129.2, 126.4, 124.3, 22.1. $^{11}$B NMR (128 MHz, acetone-$d_6$) δ 3.44. $^{19}$F NMR (376 MHz, acetone-$d_6$) δ -140.5. IR (neat, cm$^{-1}$): 3054, 3015, 2724, 1615, 1540, 1274, 1212, 952.

Potassium (4-Cyanophenyl) trifluoroborate (8c)

Following the general procedure C, syringe was loaded with a solution of 4-iodobenzonitrile (229.0 mg, 1.0 mmol), B$_2$(OH)$_2$ (134.4 mg, 1.5 mmol), in 10.0 mL volume (MeOH/H$_2$O = 4/1). The flow rate was 78 μL/min. After steady state, a sample solution was collected into a graduated cylinder for 102.6 min (8.0 mL, 0.8 mmol). The crude reaction was moved to a 25 mL round bottom flask and cooled to 0 °C, then KHF$_2$ was added (1.2 mL of a 4.5 M aqueous solution, 6.5 equiv). The title compound was obtained as a white solid in 75% yield (125.3 mg). Mp: > 250 °C.
Spectral data were in accordance with those published.\textsuperscript{[11]} \textsuperscript{1}H NMR (400 MHz, acetone-\text{d}_6) \delta 7.63 (d, \textit{J} = 7.2 Hz, 2H), 7.46 (d, \textit{J} = 7.6 Hz, 2H). \textsuperscript{13}C NMR (100 MHz, DMSO-\text{d}_6) \delta 132.0, 129.9, 120.0, 107.6. \textsuperscript{19}F NMR (376 MHz, DMSO-\text{d}_6) \delta -140.4. IR (neat, cm\textsuperscript{-1}): 3078, 3051, 3032, 2231, 1393, 1211, 1190, 945.

\textit{Potassium (4-Fluorophenyl) trifluoroborate (8d)}

Following the general procedure C, syringe was loaded with a solution of 1-fluoro-4-iodobenzene (222.0 mg, 1.0 mmol), B\textsubscript{2}(OH)\textsubscript{2} (134.4 mg, 1.5 mmol), in 10.0 mL volume (MeOH/H\textsubscript{2}O = 4/1). The flow rate was 78 \textmu L/min. After steady state, a sample solution was collected into a graduated cylinder for 102.6 min (8.0 mL, 0.8 mmol). The crude reaction was moved to a 25 mL round bottom flask and cooled to 0°C, then KHF\textsubscript{2} was added (1.2 mL of a 4.5 M aqueous solution, 6.5 equiv). The title compound was obtained as a white solid in 95% yield (153.5 mg). Mp: > 250 °C. Spectral data were in accordance with those published.\textsuperscript{[11]} \textsuperscript{1}H NMR (400 MHz, DMSO-\text{d}_6) \delta 7.32 (t, \textit{J} = 6.8 Hz, 2H), 6.88 (t, \textit{J} = 8.8 Hz, 2H). \textsuperscript{13}C NMR (100 MHz, DMSO-\text{d}_6) \delta 162.0, 159.7, 132.8 (d, \textit{J} = 8.0 Hz), 112.7 (d, \textit{J} = 19.0 Hz). \textsuperscript{19}F NMR (376 MHz, DMSO-\text{d}_6) \delta -118.6, -139.2. IR (neat, cm\textsuperscript{-1}): 3027, 1917, 1607, 1396, 1226, 1212, 969.

\textit{Potassium Pyridine-3-yl trifluoroborate (8e)}

Following the general procedure C, syringe was loaded with a solution of 3-iodopyridine (205.0 mg, 1.0 mmol), B\textsubscript{2}(OH)\textsubscript{2} (134.4 mg, 1.5 mmol), in 10.0 mL volume (MeOH/H\textsubscript{2}O = 4/1). The flow rate was 78 \textmu L/min. After steady state, a sample solution was collected into a graduated cylinder for 102.6 min (8.0 mL, 0.8 mmol). The crude reaction was moved to a 25 mL round bottom flask and cooled to 0°C, then KHF\textsubscript{2} was added (1.2 mL of a 4.5 M aqueous solution, 6.5 equiv). The title compound was obtained as a white solid in 89% yield (132.0 mg). Mp: 222 - 225 °C. \textsuperscript{1}H NMR (400 MHz, DMSO-\text{d}_6) \delta 8.46 (s, 1H), 8.25 (d, \textit{J} = 4.0 Hz, 1H), 7.61 (d, \textit{J} = 6.8 Hz, 1H), 7.10 (t, \textit{J} = 5.8 Hz, 1H). \textsuperscript{13}C NMR (100 MHz, DMSO-\text{d}_6) \delta 152.5, 146.3, 138.6, 122.2. \textsuperscript{19}F NMR (376 MHz, DMSO-\text{d}_6) \delta -139.0. HRMS (ESI): Calculated for C\textsubscript{3}H\textsubscript{2}BF\textsubscript{3}N (M-K): 146.0389, Found: 146.0394. IR (neat, cm\textsuperscript{-1}): 3039, 3023, 1590, 1404, 1224, 1190, 1049, 926.

\textit{Potassium (4-Ethoxycarbonyl)phenyl trifluoroborate (8f)}

Following the general procedure C, syringe was loaded with a solution of ethyl 4-bromobenzoate (229.0 mg, 1.0 mmol), B\textsubscript{2}(OH)\textsubscript{2} (134.4 mg, 1.5 mmol), in 10.0 mL volume (MeOH/H\textsubscript{2}O = 4/1). The flow rate was 78 \textmu L/min. After steady state, a sample solution was collected into a graduated
cylinder for 102.6 min (8.0 mL, 0.8 mmol). The crude reaction was moved to a 25 mL round bottom flask and cooled to 0 °C, then KH\textsubscript{2}F was added (1.2 mL of a 4.5 M aqueous solution, 6.5 equiv). The title compound was obtained as a white solid in 54% yield (110.6 mg). Mp: 207 – 209 °C.

$^1$H NMR (400 MHz, DMSO-$d_6$) δ 7.72 (d, $J = 7.2$ Hz, 2H), 7.45 (d, $J = 7.2$ Hz, 2H). 4.29 (q, $J_1 = 6.8$ Hz, $J_2 = 6.8$ Hz, 2H), 1.32 (t, $J = 6.8$ Hz, 3H). $^{13}$C NMR (100 MHz, DMSO-$d_6$) δ 166.6, 131.3, 127.1, 126.6, 59.9, 14.2. $^{11}$B NMR (128 MHz, DMSO-$d_6$) δ 2.35. $^{19}$F NMR (376 MHz, DMSO-$d_6$) δ -139.7. HRMS (ESI): Calculated for C\textsubscript{9}H\textsubscript{9}BF\textsubscript{3}O\textsubscript{2} (M-K) : 217.0648, Found: 217.0656.
