NMR assignment of reaction products after incubation of DERA with $^{13}$C-acetaldehyde.

The integral values are related to crotonaldehyde that has the lowest integral and thus was set to one. The absolute values were determined by integration of aldehyde/olefinic protons.

$$
\int = 27
$$

(1)

$^1$H NMR (600 MHz, H$_2$O): $\delta$ (ppm) = 2.24 (d, $^3J_{1,2} = 3.0$ Hz, 3 H, 2'-H), 9.68 (q, $^3J_{1,2} = 3.0$ Hz, 1 H, 1'-H)

$^{13}$C NMR (151 MHz, H$_2$O): $\delta$ (ppm) = 32.85 (C-2), 209.49 (C-1)

$$
\int = 2.3
$$

$^1$H NMR (600 MHz, H$_2$O): $\delta$ (ppm) = 1.20 (d, $^3J_{6,5} = 6.4$ Hz, 3 H, 6'-H), 1.64 (ddd, $^3J_{4ax,4eq} = 13.6$ Hz, $^3J_{4ax,5} = 10.1$ Hz, $^3J_{4ax,3} = 3.3$ Hz, 1 H, 4'-H$_a$), 1.78 (m, $^3J_{4eq,4ax} = 13.6$ Hz, $^3J_{4eq,3} = 4.0$ Hz, $^3J_{4eq,5} = 3.0$ Hz, 1 H, 4'-H$_b$), 1.78 (m*, $^3J_{2eq,2ax} = X^*H$, $^3J_{2ax,1} = X^*H$, $^3J_{2ax,3} = 3.0$ Hz, 1 H, 2'-H$_a$), 1.93 (ddd, $^3J_{2eq,2eq} = X^*H$, $^3J_{2eq,3} = 3.0$ Hz, $^3J_{2eq,1} = X^*H$, $^3J_{2eq,4ax} = X^*H$, 1 H, 2'-H$_b$), 4.40 (d, $^3J_{5,6} = 10.1$ Hz, $^3J_{5,4ax} = 6.4$ Hz, $^3J_{5,4eq} = 3.0$ Hz, 1 H, 5'-H), 4.21 (qui, $^3J_{3,2a} = 4.0$ Hz, 1 H, 3'-H), 5.25 (dd, $^3J_{1,2} = 3.4$ Hz, 1 H, 1'-H$_a$)

$^{13}$C NMR (151 MHz, H$_2$O): $\delta$ (ppm) = 23.12 (C-6), 38.32 (C-2), 40.70 (C-4), 64.23 (C-5), 66.34 (C-3), 94.17 (C-1)
$^1$H NMR (600 MHz, H$_2$O): $\delta$ (ppm) = 1.33 (d, $^3\text{J}_{2,1} = 5.2$ Hz, 3 H, 2'-H), 5.25 (q, $^3\text{J}_{1,2} = 5.2$ Hz, 1 H, 1'-H)

$^{13}$C NMR (151 MHz, H$_2$O): $\delta$ (ppm) = 25.92 (C-2), 91.00 (C-1)

$^1$H NMR (600 MHz, H$_2$O): $\delta$ (ppm) = 1.21 (d, $^3\text{J}_{4,3} = 6.3$ Hz, 3 H, 4'-H), 1.73 (m*, 1 H, 2'-H), 1.79 (m*, 1 H, 2'-H), 3.39 (m*, 1 H, 3'-H), 5.18 (dd, $^3\text{J}_{1,2a} = 6.6$ Hz, $^3\text{J}_{1,2b} = 5.0$ Hz, 1 H, 1'-H)

$^{13}$C NMR (151 MHz, H$_2$O): $\delta$ (ppm) = 25.00 (C-4), 48.37 (C-2), 67.40 (C-3), 91.76 (C-1)

$^1$H NMR (600 MHz, H$_2$O): $\delta$ (ppm) = 2.05 (dd, $^3\text{J}_{4,3} = 6.8$ Hz, $^4\text{J}_{4,2} = 1.6$ Hz, 3 H, 4'-H), 6.22 (ddq, $^3\text{J}_{2,3} = 15.4$ Hz, $^3\text{J}_{2,1} = 8.3$ Hz, $^4\text{J}_{2,4} = 1.6$ Hz, 1 H, 2'-H), 7.20 (dq, $^3\text{J}_{4,2} = 15.4$ Hz, $^3\text{J}_{3,4} = 6.8$ Hz, 1 H, 3'-H), 9.37 (d, $^3\text{J}_{1,2} = 8.3$ Hz, 1 H, 1'-H)

$^{13}$C NMR (151 MHz, H$_2$O): $\delta$ (ppm) = 21.15 (C-4), 135.8 (C-2), 162.9 (C-3), 201.9 (C-1)

$^1$H NMR (600 MHz, H$_2$O): $\delta$ (ppm) = 1.91 (s, 3 H, 2'-H)

$^{13}$C NMR (151 MHz, H$_2$O): $\delta$ (ppm) = 25.95 (C-2), 184.08 (C-1)

$^1$H NMR (600 MHz, H$_2$O): $\delta$ (ppm) = 1.37 (d, $^3\text{J}_{2,1} = 5.2$ Hz, 3 H, 2'-H), 5.27 (q, $^3\text{J}_{1,2} = 5.2$ Hz, 1 H, 1'-H)

$^{13}$C NMR (151 MHz, H$_2$O): $\delta$ (ppm) = 22.20 (C-2), 101.70 (C-1)

*Coupling constant or integral could not be measured due to signal overlap.
2. SI Figures

Figure S1. Acetaldehyde tolerance of DERAs from *E. coli* (16 outer lysines) and *C. bovis* (1 outer lysine). The result demonstrates that a lower number of exposed lysine residues does not impart enhanced acetaldehyde stability.
Figure S2. $[^{1}H,^{15}N]$-TROSY spectrum of $[^{15}N]$ monomeric E. coli DERA (K58E-Y96W). Based on the backbone assignment, signals of the NH-shifts are labelled by their corresponding amino acids.
Figure S3. Comparison of the secondary structure prediction by CSI 2.0 and values obtained from the 3D structure of monomeric DERA by DSSP (hydrogen bonding criteria). Both diagrams show a very similar pattern, indicating a correct backbone resonance assignment.

Figure S4. Evaluation of the chemical shifts of Cα atoms derived from HNCA experiments with monomeric DERA. (A) Cα chemical shift of each amino acid assigned by NMR. (B) Chemical shift differences (ΔCS) between the calculated values (predicted by SPARTA based on the 3D structure) and the measured values. Low ΔCS (< 5 ppm for all amino acids) support the correctness of the protein backbone assignment.
Figure S5. $^{13}$C spectrum of unlabelled DERA after incubation with $[U-^{13}$C$]-$acetaldehyde and removal of free reaction products. The assignment is based on a prediction of chemical shifts. Predicted shifts (in ppm) are indicated in black within the chemical structures of the postulated (red) and the alternative (blue) covalently bound ligand, whereas coloured labels in the spectrum refer to the carbon atoms giving rise to the respective peaks. Sharp signals are probably caused by fast tumbling small molecules while broad peaks can be related to $^{13}$C-labeled compounds bound to macromolecules.

Figure S6. Diffusion-ordered spectroscopy (iDOSY-ctHSQC) of $^{13}$C-acetaldehyde incubated DERA before and after heating at 50°C. Macromolecules such as proteins typically show diffusion coefficients on the order of $10^{-10}$ m²/s in aqueous solutions, whereas small-molecule species like acetaldehyde and the separated reaction products diffuse at least one order of magnitude faster (green signals). Hence, the blue signals in the iDOSY-ctHSQC spectrum correspond to $^{13}$C-labeled compounds which are still bound to the protein after a washing step. While signals at 3.6 ppm are probably caused by remaining glycerol residues in solution, the region of 2-1.8 ppm could be assigned to aliphatic carbon atoms and below 1.5 ppm to methyl groups. After heating at 50°C, signals between 2-1.8 ppm (red) shift to higher diffusion coefficients, which indicates that the compounds have been (partly) cleaved from the protein.
Figure S7. HSQC spectra of [U-15N] monomeric E. coli DERA (K58E-Y96W) at three different states (untreated; following incubation with acetaldehyde; after an additional heating step).
Figure S8. Time-dependent relative activity of wt DERA during incubation with crotonaldehyde at different concentrations.

Figure S9. Alternative reaction mechanism leading to DERA inactivation. The nitrogen atom of K167 acts as a nucleophile for the Michael addition to the $sp^2$ hybridized $C_β$ atom of crotonaldehyde, while the aldehyde function of crotonaldehyde forms a hemithioacetal with the cysteine residue.

Figure S10. Time-dependent relative activity of DERA C47M during incubation with 1 M acetaldehyde.
Figure S11. Time dependent (A) acetaldehyde conversion and (B) formation of single aldol product by DERA wt and C47M mutant at different substrate concentrations. Substrate and product concentrations were determined via integration of $^1$H-signals in the NMR spectra with known initial substrate concentration.

Figure S12. Concentration dependence of acetaldehyde stability of DERA from *E. coli*. The time dependent relative activity was measured during incubation of different DERA concentrations in 300 mM of acetaldehyde. Afterwards the half-life activity with standard deviation was determined as an exponential decay function first order.
