Table of contents

General experimental details
Synthesis and separation of IC\textsubscript{60}BA isomers
UV-Vis absorption spectra of IC\textsubscript{60}BA isomers
\textsuperscript{1}H NMR and \textsuperscript{13}C NMR of e\textsubscript{1}, e\textsubscript{2} and trans-3
Mass spectra of e\textsubscript{1}, e\textsubscript{2} and trans-3
Experimental and data for X-ray crystallography
The measured TGA and DSC data of e\textsubscript{1}, e\textsubscript{2} and trans-3
Electrochemical data
Device fabrication and characterisation
AFM images of P3HT:mixture blend film
General experimental details

Indene (99%) was purchased from Sigma-Aldrich Co.. C_{60} (95%) was purchased from Yongxin Co. (China). \(o\)-dichlorobenzene was purchased from Alfa-Aesar Co.. P3HT (4002-E) was purchased from Rieke Metals Inc.

Flash chromatography purification was performed following standard chromatographic methods. Analytical and preparative HPLC was carried out on LC908-C60 (Jai CO., LTD.). A Cosmosil® Buckyprep-D column (4.6 ID × 250 mm) and COSMOSIL 5PBB column (10 x 250 mm) were used with toluene as eluent (3 mL/min) and UV detection was recorded at 350 nm.

\(^1\)H NMR spectra were measured on a Bruker DMX-400 spectrometer. \(^{13}\)C NMR were performed on a Bruker DMX-600 spectrometer. Chemical shift was reported in ppm relative to the singlet of CDCl\(_3\) at 7.26 ppm for \(^1\)H NMR and 77.63 ppm for \(^{13}\)C NMR. High resolution mass spectra were measured by MALDI-FT MS. Absorption spectra were taken on a Hitachi U-3010 UV-vis spectrophotometer. Thermogravimetric analysis (TGA) was performed under a nitrogen atmosphere on Shimadzu thermogravimetric analyzer (model DTG-60) at heating rate of 10 °C/min. Differential scanning calorimetry (DSC) measurement was recorded on METTLER differential scanning calorimeter (DSC822e) under nitrogen at heating rate of 10 °C/min. The electrochemical cyclic voltammetry was conducted on a Zahner IM6e Electrochemical Workstation. A Pt disk was taken as the working electrode, Pt wire as the counter electrode, and Ag/Ag\(^{+}\) electrode (0.01 M AgNO\(_3\), 0.09 M NBu\(_4\)PF\(_6\) in acetonitrile) as the reference electrode. A solution of \(o\)-dichlorobenzene: acetonitrile (V:V = 5:1) with 0.1 M tetrabutylammonium hexafluorophosphate (NBu\(_4\)PF\(_6\)) was used as electrolyte, and the scan rate was fixed at 100 mV s\(^{-1}\). The optical microscope images were taken on polarized optical microscope (POM) OLYMPUS BX51.

Synthesis and separation of IC\(_{60}\)BA isomers

Indene (2.32 g, 20 mmol) and C\(_{60}\) (1.44 g, 2 mmol) were dissolved in 60 mL of \(o\)-dichlorobenzene. Then the solution was heated to 180 °C and refluxed for 12 h. Subsequently, the reaction mixture was subjected to silica column. The unreacted C\(_{60}\), indene-C\(_{60}\) monoadduct (IC\(_{60}\)MA), and IC\(_{60}\)BA were separated and purified by silica gel column chromatography with 10% toluene in hexane several times. A total of 410 mg IC\(_{60}\)MA (yield 22%) and 680 mg IC\(_{60}\)BA mixture (yield 35.6%) were obtained. Then the obtained IC\(_{60}\)BA mixture was subjected to HPLC with Cosmosil® Buckyprep-D column (4.6 ID × 250 mm) and COSMOSIL 5PBB column (10 x 250 mm), getting fraction 1 (F1, trans-2, 10mg), F2 (trans-2, 25mg), F3 (trans-2, 20mg), F4 (trans-3, 120mg), F5 (trans-4, 80mg), F6 (e, 40mg). The six fractions were further purified with COSMOSIL 5PBB column (10 x 250 mm) column under recycle mode. However, only F6 was successfully separated into e1 (18mg) and e2 (18mg). The isomers in other fractions were too close to separate from each other.
UV-Vis absorption spectra of IC\textsubscript{60}BA isomers

Device fabrication and characterisation

Fabrication and Characterization of PSCs: The PSCs were fabricated in the configuration of the traditional sandwich structure ITO/PEDOT:PSS/P3HT:IC$_{60}$BA/Ca/Al. The ITO glass was cleaned by sequential ultrasonic treatment in detergent, deionized water, acetone, and isopropanol, and then treated in an ultraviolet-ozone chamber (Ultraviolet Ozone Cleaner, Jelight Company, USA) for 20 min. Then PEDOT:PSS (poly (3, 4-ethylene dioxythiophene):poly(styrene sulfonate)) (Baytron PVPAI4083, Germany) was filtered through a 0.45 μm filter and spin coated at 2500 rpm for 35 s on the ITO electrode. Subsequently, the PEDOT:PSS film was baked at 150 °C for 20 min in the air. The blend solution of P3HT and different fullerene derivative acceptors in o-dichlorobenzene (ODCB) (total concentration is 34 mg mL$^{-1}$, weight ratio of P3HT: acceptor is 1:1) was spin-coated on the PEDOT:PSS layer. The blend films were then put into glass petridishes while still wet to undergo solvent annealing process. The thickness of the photoactive layer was estimated by Surface Profiler in the range of 180–240 nm. The device was annealed at 150 °C for 10 min. A bilayer cathode consisted of Ca (20 nm) capped with Al (100 nm) was thermal-evaporated under a shadow mask in a base pressure of ca. 10$^{-5}$ Pa. The device active area of the PSCs is ca. 4 mm$^2$. The $J$–$V$ measurement of the devices was conducted on a computer-controlled Keithley 236 Source Measure Unit. Device characterization was done in golvebox under simulated AM 1.5G irradiation (100 mW cm$^{-2}$) using a xenon-lamp-based solar simulator (from Newport Co., LTD.). The EQE measurements of the PSCs were performed by Stanford Research Systems model SR830 DSP lock-in amplifier coupled with WDG3 monochromator and 500 W xenon lamp. The light intensity at each wavelength was calibrated with a standard single-crystal Si photovoltaic cell.

The space charge limited current (SCLC) of IC$_{60}$BA isomers were studied using electron-only devices to find the charge-transport properties. The electron-only devices, consisting of active layer sandwiched between a ZnO coated ITO electrode and LiF/Al counter-electrode as the hole-blocking contact, were fabricated. From the current density as a function of voltage data, the electron mobility in the trap-free space-charge limited current (SCLC) region can be estimated using the Mott-Gurney equation:

$$J = \frac{9}{8}\varepsilon_0\varepsilon_r\mu \frac{V^2}{d^3}$$

where $\varepsilon_0$ is the permittivity of the vacuum, $\varepsilon_r$ is the relative permittivity of the material, $\mu$ is the charge-carrier mobility, $V$ is the effective voltage, $V = V_{\text{appl}} - V_{\text{bi}}$, where $V_{\text{appl}}$ is the applied voltage, and $V_{\text{bi}}$ is the built-in potential which results from the difference in the work function of the anode and the cathode, and $d$ is the sample thickness. Using this expression, the electron mobility of the IC$_{60}$BA isomers were calculated.
Figure S19 the $J^{1/2}-V$ curves for electron-only devices of P3HT:IC$_{60}$BA isomers.

Table S1 Space charge limited current (SCLC) mobility of IC$_{60}$BA measured in electron-only devices.
