SUPPORTING INFORMATION

Using graphene oxide as a sacrificial support of polyoxotitanium clusters to replicate its two-dimensionality on pure titania photocatalysts

Figure S1. Histogram of the maximum lateral size distribution of GO mats (over 163 counts).

Figure S2. Raman spectra of GO and titania prepared by dissolving, drying and calcining \( \text{Ti}_{16}\text{O}_{16}(\text{OEt})_{32} \) clusters together with GO. A stands for anatase. Graphene oxide Raman bands D and G are indicated.
