Supplementary Figures

Fig. S1 Time-lapse microscope images of hAD-MSCs spheroids treated with 1200 µg/ml Qdot solution. Qdots were introduced to the spheroid after cells were incubated for 24 for spheroid formation (tQDOT=24 h). Effect of Qdots to spheroid morphology was monitored for 24 h.
Fig. S2 Increase in hAD-MSCs spheroid diameters during Qdot exposure (1200 µg/ml) until 24 h. Spheroid diameters were normalized to the diameter of spheroid at the time= 0 h. Inset graph shows the linear relationship between the Qdot exposure time and the increase in spheroid diameter until 8 h (Adj. $R^2=0.977$).

Fig. S3 Cell viability data obtained from CTB assay. The fluorescence signals were normalized to untreated control samples. Data points are means ± standard error of 3±1 independent experiments which were conducted with 4 replicates. * indicates significant difference at 0.01 level. $p < \alpha=0.01$ (ANOVA one-way).
