Smart sensory material for divalent cations: dithizone immobilized membrane for optical analysis
Giancarla Alberti*, Silvia Re, Anna Maria Tivelli, Raffaela Biesuz
*Dipartimento di Chimica, University of Pavia, via Taramelli 12, 27100 Pavia, Italy.

Table of contents

S1. Kinetics profiles of Cu(II), Hg(II) and Zn(II) on mem-DTZ
S2. Sorption isotherms for Cd(II), Hg(II) and Zn(II) on mem-DTZ
S3. Sorption profiles of Cd(II), Cu(II), Hg(II) and Zn(II) on mem-DTZ
S4. Colorimetric dose-response curve for Cu(II), Cd(II) and Hg(II) on mem-DTZ
S5. Colorimetric standard addition method for Cu(II), Cd(II) and Hg(II) in real samples
S1. Kinetics profiles of Cu(II), Hg(II) and Zn(II) on mem-DTZ

**Figure S1.** Sorption kinetic of Cu(II) on mem-DTZ. \( V = 10 \) mL; \( w = 0.025 \) g mem-DTZ \((1 \times 2 \text{ cm})\); Cu(II) \(8.1 \mu\text{M},\) \(\mathrm{pH} = 2, I = 0.1 \text{ M HCl/KCl}\)

**Figure S2.** Sorption kinetic of Hg(II) on mem-DTZ. \( V = 10 \) mL; \( w = 0.025 \) g mem-DTZ \((1 \times 2 \text{ cm})\); Hg(II) \(0.7 \mu\text{M},\) \(\mathrm{pH} = 2, I = 0.1 \text{ M HCl/KCl}\)
Figure s3  Sorption kinetic of Zn(II) on mem-DTZ. V = 10 mL; w = 0.025 g mem-DTZ (1 × 2 cm); Zn(II) 6.1 μM, pH = 4.5, I =0.1 M KCl

S2. Sorption isotherms of Cd(II), Hg(II) and Zn(II) on mem-DTZ

Figure s4  Sorption isotherm of Cd(II) on mem-DTZ. V = 10 mL; w = 0.025 g mem-DTZ (1 × 2 cm); Cd(II) solutions from 0 to 45 μM, pH = 4.5, I =0.1 M KCl. The continuous line is the best fitting obtained applying eq.2, by nonlinear regression. Fitting parameters: $K_L = 1.0(3) \times 10^7$ mol L$^{-1}$ and $q_{max} = 2.7(2) \times 10^{-3}$ mmol g$^{-1}$
Figure s5  Sorption isotherm of Hg(II) on mem-DTZ. V = 10 mL; w = 0.025 g mem-DTZ (1×2 cm); Hg(II) solutions from 0 to 30 μM, pH = 2, I =0.1 M HCl/KCl. The continuous line is the best fitting obtained applying eq.2, by nonlinear regression. Fitting parameters: $K_L =1.0(6) \times 10^7$ mol L$^{-1}$ and $q_{\text{max}} = 5.8(2) \times 10^{-3}$ mmol g$^{-1}$.

Figure s6  Sorption isotherm of Zn(II) on mem-DTZ. V = 10 mL; w = 0.025 g mem-DTZ (1×2 cm); Cd(II) solutions from 0 to 45 μM, pH = 4.5, I =0.1 M KCl. The continuous line is the best fitting obtained applying eq.2, by nonlinear regression. Fitting parameters: $K_L =1.0(5) \times 10^7$ mol L$^{-1}$ and $q_{\text{max}} = 1.9(2) \times 10^{-3}$ mmol g$^{-1}$. Since at pH 4.5 the maximum percentage of Zn(II) that can be sorbed on the mem-DTZ is around 70% (see sorption profiles, Figure s...) a value of $q_{\text{max}}$ lower of that found for the other cations was expected.
S3. Sorption profiles of Cd(II), Cu(II), Hg(II) and Zn(II) on mem-DTZ

S3.1 – System Cd(II)/mem-DTZ

**Figure s7** Sorption profiles of Cd(II) on mem-DTZ. \( V = 10 \, \text{mL}; \, w = 0.025 \, \text{g mem-DTZ}; \) ○ profile without ligand in solution, Cd(II) 1.9 µM, \( I = 0.1 \, \text{M KCl} \). ○ profile with NTA1 mM, Cd(II) 1.9 µM, \( I = 0.1 \, \text{M KCl} \). ○ profile with PDCA 0.5 mM, Cd(II) 1.8 µM, \( I = 0.1 \, \text{M KCl} \). ○ profile with PDCA 2.5 mM, Cd(II) 1.8 µM, \( I = 0.1 \, \text{M KCl} \)

**Figure s8** Desorption profile of Cd(II) on mem-DTZ using as extractant PDCA. \( V = 10 \, \text{mL}; \, w = 0.025 \, \text{g mem-DTZ}. \) PDCA from 0 to 0.01 M; Cd(II) 1.9 µM; pH = 4.5; \( I = 0.1 \, \text{M KCl} \)
Continuous lines in Figures s7 and s8 were obtained by considering the following complexation reactions in solid phase and the corresponding exchange coefficients:

\[
\begin{align*}
\text{Cd} + \text{DTZ} & \rightleftharpoons \text{CdDTZ} \\
\text{Cd} + 2 \text{DTZ} & \rightleftharpoons \text{Cd(DTZ)}_2
\end{align*}
\]

(The values of the exchange coefficients (at I=0.1 M) and intrinsic complexation constants reported are the media of the data obtained in the different experiments of Figures s10 and s11. Numbers in parenthesis are the standard deviation on the last digits.)
S3.4 – System Zn(II)/mem-DTZ

**Figure s13** Sorption profiles of Zn(II) on mem-DTZ. $V = 10$ mL; $w = 0.025$ g mem-DTZ; ● profile without ligand in solution, Zn(II) 3.9 µM, $I = 0.1$ M KCl. ○ with NTA 0.5 mM, Zn(II) 3.3 µM, $I = 0.1$ M KCl profile with oxalate 1.0 mM, Zn(II) 3.2 µM, $I = 0.1$ M KCl

Continuous lines in Figures s13 were obtained by considering the following complexation reactions in solid phase and the corresponding exchange coefficients

$$
\text{Zn} + \text{DTZ} \rightleftharpoons \text{ZnDTZ}
$$

$$
\text{Zn} + 2 \text{DTZ} \rightleftharpoons \text{Zn(DTZ)}_2
$$

S4. Colorimetric dose-response curve for Cu(II), Cd(II) and Hg(II) on mem-DTZ

Figure s14 Colorimetric dose-response curve for Cu(II) on mem-DTZ. Top of the graph: digital pictures of the sensory membranes, taken after dipping in aqueous solutions of Cu(II) at increasing concentration. 

\[ V = 10 \text{ mL}, \quad w = 0.025 \text{ g mem-DTZ (1} \times 2 \text{ cm)}, \quad \text{pH} = 2, \quad I = 0.1 \text{ M HCl/KCl} \]

Figure s15 Colorimetric dose-response curve for Cd(II) on mem-DTZ. Top of the graph: digital pictures of the sensory membranes, taken after dipping in aqueous solutions of Cd(II) at increasing concentration. 

\[ V = 10 \text{ mL}, \quad w = 0.025 \text{ g mem-DTZ (1} \times 2 \text{ cm)}, \quad \text{pH} = 5, \quad I = 0.1 \text{ M KCl} \]
Figure s16 Colorimetric dose-response curve for Hg(II) on mem-DTZ. Top of the graph: digital pictures of the sensory membranes, taken after dipping in aqueous solutions of Hg(II) at increasing concentration. 

\( V = 10 \, \text{mL}, \ w = 0.025 \, \text{g mem-DTZ} \, (1 \times 2 \, \text{cm}), \, \text{pH} = 2, \, I = 0.1 \, \text{M HCl/KCl}. \)
SSS. Colorimetric standard addition method for Cu(II), Cd(II) and Hg(II) in real samples

**Figure s17** Determination of Cu(II) in the reference material “Sewage Sludge CC136A”: standard additions method applied to the solution obtained by mineral digestion of the solid sample (see paragraph 2.2.5). $V = 15 \text{ mL}$ of the three times diluted sample solution; $w = 0.025 \text{ g mem-DTZ (1} \times 2 \text{ cm)}$; $pH = 2$. Linear regression fit: $y = 14.1(7) \times x + 1.49(8)$ ($R^2 = 0.997$)
Figure s18  Determination of Cu(II) in a commercial white wine (Ronco San Crispino, Italy): standard additions method. $V = 20 \text{ mL; } w = 0.025 \text{ g mem-DTZ (1}\times2 \text{ cm); pH = 3.6. Linear regression fit: } y = 10.3(3) \cdot x + 1.46(6) \ (R^2 = 0.999)$

Figure s19  Determination of Cd(II) in spiked tap water (spike 0.1 mg L$^{-1}$ Cd(II)): standard additions method. $V = 50 \text{ mL; } w = 0.025 \text{ g mem-DTZ (1}\times2 \text{ cm); pH = 8.1. Linear regression fit: } y = 15(2) \cdot x + 1.8(3) \ (R^2 = 0.980)$
