1 Materials and Methods

All manipulations were performed in a Glove box MB Unilab produced by MBraun or using standard Schlenk techniques under an inert atmosphere of anhydrous N₂. Dry, oxygen-free solvents (CH₂Cl₂, n-pentane, n-hexane, toluene) were prepared using an Innovative Technologies solvent purification system. Deuterated dichloromethane (CD₂Cl₂) was purchased from Cambridge Isotope Laboratories Inc., distilled from CaH₂ and stored over molecular sieves (4 Å) for at least two days prior to use. Deuterated bromobenzene (C₆D₅Br) was purchased from Cambridge Isotope Laboratories Inc. degassed and stored over molecular sieves (4 Å) for at least two days prior to use. If not stated otherwise commercial reagents were used as received without further purification. Commercial olefin substrates were routinely filtered over silica before use. XeF₂ was purchased from Apollo Scientific and used without further purification. All glassware was oven-dried at temperatures above 180°C prior to use. NMR spectra were measured on a Bruker AVANCE 400 ¹H (400.03 MHz), ¹³C (100.59 MHz), ¹⁹F (376.49 MHz), ³¹P (161.94 MHz), ¹¹B (128.37 MHz) at 25 °C, on an Agilent DD2 500 ¹H (499.7 MHz), ¹³C (125.7 MHz) at 27 °C, on an Agilent DD2 500 ¹H (499.9 MHz), ¹³C (125.7 MHz), ¹⁹F (470.3 MHz), ³¹P (202.4 MHz), ¹¹B (160.4 MHz) at 25 °C, on an Agilent DD2 600 ¹H (600.0 MHz), ¹³C (150.9 MHz), ¹⁹F (564.7 MHz), ³¹P (242.9 MHz), ¹¹B (192.5 MHz) at 26 °C or on an Agilent DD2 700 ¹H (700.0 MHz), ¹³C (176.0 MHz), ¹⁹F (658.0 MHz) at 27 °C. Assignments of the carbon atoms in the ¹³C spectra were performed via indirect deduction from the cross-peaks in 2D correlation experiments (HMBC; HSQC). Chemical shifts are relative to tetramethylsilane (δ¹H 0.0, δ¹³C 0.0) and were referenced to the residual proton signal of the deuterated solvent, CFCl₃ (external, δ¹⁹F 0.0), H₃PO₄ (85% in H₂O, external, δ³¹P 0.0), BF₃·OEt₂ (external, δ¹¹B 0.0). Chemical shifts (δ) are reported in ppm, multiplicity is reported as follows (s = singlet, d = doublet, t = triplet, q = quartet, pr.q. = partially...
relaxed quartet, \( p = \) pentet, \( m = \) multiplet, \( br = \) broad signal) and coupling constants \( (J) \) are reported in Hz. Assignments of individual resonances were done using 2D techniques (HMBC, HSQC, HH-COSY) when necessary. Yields of products in solution were determined by integration of all resonances observed in the respective NMR spectra if not stated otherwise. High-resolution mass spectra (HRMS) were obtained on a micro mass 70S-250 spectrometer (EI), an ABI/Sciex QStar Mass Spectrometer (DART), or on a JOEL AccuTOF-DART (DART).

Compounds \( 4^{[S1]} \), \( 14^{[S2]} \), \( 15^{[S3]} \), \( 16^{[S3]} \) and \( [\text{Et}_3\text{Si}][\text{B(C}_6\text{F}_5)_4]2(\text{C}_7\text{H}_8)^{[S4]} \) were synthesized according to literature procedures.

### 2 Synthesis and Spectroscopic Data

#### 2.1 Synthesis of \( \text{o-Ph}_2\text{P(C}_6\text{H}_4)\text{BCy}_2 \) (2)

![Structure](structure.png)

The synthesis was done according to a modified literature procedure for \( \text{o-((iPr)_2P(C}_6\text{H}_4)\text{BCy}_2 \).\([S5]\)

To solution of \( \text{o-Ph}_2\text{P(C}_6\text{H}_4)\text{Br} \) (341.1 mg, 1.00 mmol) in 2 ml of THF was added 0.7 ml 1.6 M \( \text{n-BuLi} \) in hexanes at -30 °C. Subsequently a precooled (-30°C) solution of 1M \( \text{Cy}_2\text{BCl} \) in hexanes diluted with 4 ml THF was added dropwise. After the addition the solution was allowed to warm to room temperature and stirred for 20 h. Volatiles were removed and the residue was extracted with 10 ml of pentane. The resulting suspension was filtered over Celite and a small silica plug. Removal of volatiles gave the title compound 2 as a colorless oil (281.2 mg, 0.43 mmol, 64 %).

1,2-dibromo-tetrafluorobenzene (2.00 g, 6.5 mmol, 1 eq.) was dissolved in Et$_2$O (30 ml), cooled to -50 °C and "Turbo-Grignard" solution (iPrMgCl-LiCl, 1.3 M in THF, 5.0 ml, 6.5 mmol, 1 eq.) was added dropwise over 20 min and the resulting colorless solution stirred for 2.5 h allowing to warm to 0 °C. A light, colorless precipitate had formed. The suspension was cooled to -60 °C and Ph$_2$PCl was added neat at once to the vigorously stirred suspension. The reaction mixture was allowed to warm to room temperature slowly and stirred overnight. Then, volatiles were removed in vacuum at 50 °C and the residue taken up in hexanes (20 ml) and silica gel (ca. 5 ml) was added. The insoluble components were removed by filtration in a glovebox and washed with pentane (10 ml) twice. The combined mother and wash liquors were evaporated to dryness to give 2.21 g crude product. It was taken up in pentane (5 ml) at room temperature and the suspension allowed to further precipitate at -35 °C. The supernatant was removed by decantation at -35 °C and the precipitate washed with pentane (2 ml) twice at -35 °C. Drying of the precipitate in vacuum gave compound 6 as colorless solid (2.15 g, 5.2 mmol, 84%).

![Diagram of compound 9]

To a solution of o-Ph₂PF₂(C₆H₄)BCy₂ (3) (119.1 mg, 0.25 mmol) in toluene (4 ml) was added freshly prepared [Et₃Si][B(C₆F₅)₄]·2C₇H₈ (220.1 mg, 0.225 mmol, 0.9 eq.). The resulting suspension was stirred at room temperature for 20 min. The resulting suspension separated into a yellow oil and colorless supernatant upon standing. The supernatant was removed by decantation and the oil was treated with 3 x 2 ml of pentane. The resulting white powder was dried and then recrystallized by taking it up in CH₂Cl₂ (1 ml) and precipitation with pentane (3 ml). The resulting solid was washed three times with pentane (2 ml) and dried in vacuum. Finally, the solid was re-dissolved in CH₂Cl₂ (1 ml) and the volatiles were removed in order to get rid of co-crystallizing pentane. Compound 9 was obtained as colorless solid (193.4 mg, 0.17 mmol, 76%).

In a glovebox, \([\text{Ph}_3\text{C}]\)\([\text{B(C}_6\text{F}_5)_4]\) (400 mg, 0.43 mmol, 0.95 eq.) was dissolved in toluene (5 ml) and triethylsilane (160 mg, 1.37 mmol, 3 eq) was added to the stirred deep red solution. The solution turns into an almost colorless suspension quickly which was stirred for 1 h at room temperature. Then the suspended red oil was left to settle and was separated from the supernatant solution with a pipette and added dropwise to a solution of \(\text{o-Ph}_2\text{PF}_2(\text{C}_6\text{F}_4)\text{BCy}_2\) (8) (250 mg, 0.46 mmol, 1 eq) in toluene (5 ml) at -35 °C. The resulting suspension was stirred at room temperature for 1 h at -35 °C and another 3 h at room temperature. Then pentane (5 ml) was added and the resulting suspension separated into a pale-orange oil and colorless supernatant upon standing. The supernatant was removed by decantation and the oil was washed with pentane (2 ml) twice. The oily residue was then taken up in CH\(_2\)Cl\(_2\) and stirred for 2 h at room temperature to ensure full consumption of the in-situ generated \([\text{Et}_3\text{Si}][\text{B(C}_6\text{F}_5)_4]\) before precipitation with pentane (10 ml). The oily phase of the biphasic mixture was allowed to solidify at -35 °C before removing the supernatant by decantation and washing of the residue with pentane (2 ml) twice. Drying in vacuum yields the title compound 11 as colorless foamy powder (486 mg, 0.40 mmol, 93%).

![Molecular structure of Ph₂P⁺BCy₂][OTf]

![Molecular structure of Ph₂P⁺BCy₂][B(C₆F₅)₄]

**Step 1: Methylation of o-Ph₂P(C₆H₄)BCy₂ (2) with MeOTf**

A 20 ml vial was charged with Ph₂P(C₆H₄)BCy₂ (2) (87.7 mg, 0.2 mmol) dissolved in 3 ml pentane. To this was added a solution of MeOTf (49.2 mg, 0.3 mmol, 1.5 eq.) in 2 ml pentane. The colorless solution was then stirred for 14.5 h after which a white precipitate was formed. The supernatant removed by decantation and the colorless residue washed with pentane (3 x 2 ml) giving [o-Ph₂PMe(C₆H₄)BCy₂][OTf] (13a) (79.7 mg, 0.13 mmol) in 66% yield. The triflate salt was used without further purification for the next step.

**1H NMR** (600 MHz, 298 K, C₆D₅Br): 7.49 – 7.40 (m, 6H, C₆H, 2H), 7.40 – 7.35 (m, C₆H, 2H), 7.34 – 7.30 (m, 4H, C₆H), 7.28 (m, 1H, C₆H), 6.97 (m, 1H, C₆H), 2.59 (d, JPC = 12.9 Hz, 3H, CH₃), 1.57 (m, 8H, CH₂, BCy₂), 1.23 (m, 2H, CH, BCy₂) 1.08 – 0.71 (m, 12H, CH₂; BCy₂).
