General
THF and 2-MeTHF was freshly distilled under a nitrogen atmosphere over Na/benzophenone ketyl. \(N,N,N',N'\)-tetramethylethylenediamine (TMEDA) was distilled over finely powdered CaH\(_2\), hexyllithium was purchased as a 2.3M hexane solution and was filtered on celite before using and title established by titration method.\(^1\) All the other chemicals were commercially available and used without further purification.

Magnetic Resonance spectra were recorded using 400, 500 and 600 MHz spectrometers. For the \(^1\)H, \(^{13}\)C NMR spectra (\(^1\)H NMR 400, 500, 600 MHz, \(^{13}\)C NMR 100, 125, 150 MHz), CDCl\(_3\), methanol-\(d_4\) or toluene-\(d_8\) were used as the solvents. MS-ESI analyses were performed on LC/MSD trap system VL. Melting points were uncorrected. GC-MS spectrometry analyses were carried out on a gas chromatograph (dimethylsilicon capillary column, 30 m, 0.25 mm i.d.) equipped with a mass selective detector operating at 70 eV (EI). Analytical thin layer chromatography (TLC) was carried out on precoated 0.25 mm thick plates of Kieselgel 60 F254; visualization was accomplished by UV light (254 nm) or by spraying a solution of 5 % (w/v) ammonium molybdate and 0.2 % (w/v) cerium(III) sulfate in 100 ml 17.6 % (w/v) aq. sulphuric acid and heating to 200 °C for some time until blue spots appear. For flash chromatography silica Gel 60, 0.04-0.063 mm particle size was used. The high resolution mass spectrometry (HRMS) analyses were performed using a Bruker microTOF QII mass spectrometer equipped with an electrospray ion source (ESI) operated in positive ion mode. The sample solutions (CH\(_3\)OH or CH\(_3\)OH + 0.1%v/v HCOOH) were introduced by continuous infusion at a flow rate of 180 mL min\(^{-1}\) with the aid of a syringe pump. The instrument was operated with end-plate offset and capillary voltages set to –500 V and –4500 V respectively. The nebulizer pressure was 0.4 bar (N\(_2\)), and the drying gas (N\(_2\)) flow rate was 4.0 L min\(^{-1}\). The capillary exit and skimmer 1 voltages were 90 V and 30 V, respectively. The drying gas temperature was set at 180 °C. The calibration was carried out with sodium formate: a solution made up of 10 \(\mu\)l of 98% formic acid, 10 \(\mu\)l of sodium hydroxide (1.0 M), 490 \(\mu\)l of \(i\)-propanol and 490 \(\mu\)l of deionized water. The software used for the simulations was Bruker Daltonics DataAnalysis (version 4.0). All reactions involving air-sensitive reagents were performed under argon in oven-dried glassware using syringe septum cap technique. Three experiments were executed in each optimization run, and sample were collected after reaching the steady state. The steady state was achieved after flowing the solutions for three

---

times the residence time. Chromatographic (TLC, GC) and spectroscopic analyses (1H NMR) have been used for method’s validation and ascertain yields and conversions.

Microfluidic components
For the microflow system, stainless steel (SUS304) T-shaped micromixer, with an internal diameter of 250μm, manufactured by Sanko Seiki Co., Inc. were used. Stainless steel (SUS 316) reaction microtubes, with an internal diameter of 1000 μm. Micromixer and reaction microtubes were connected with stainless steel fittings (1/16 O.D.). The microfluidic system was cooled by submersion in a cooling bath to control the temperature. The solutions were delivered in the microfluidic system by means of syringe pumps, Chemix, equipped with gas tight SGE or plastic Norm - Ject syringes.

General Procedure for the direct preparation of tert-butylesters from commercially available organolithiums. Synthesis of 1 is described.

A microfluidic system consisting of a T-shaped micromixer [M1], a microtube reaction (R1, length = 50 cm) and two pre-cooling units (P1, length = 100 cm; and P2, length = 100 cm) cooled at -50 °C was used (Figure 1). A solution of Boc₂O (0.1 M) in 2-MeTHF (flow rate: 2 mL/min) and a solution of HexLi (0.1 M) in hexane (flow rate: 2.2 mL/min) were introduced into M1 through syringe pumps. The resulting solution passes through R1 with a residence time of 5.6 s. After reaching the steady state (15 s), the out-coming solution of the product was collected for 60 s in a vial containing a saturated solution of NH₄Cl. Following extraction with Et₂O (3 x 10 mL), the collected organic phase were dried over Na₂SO₄, filtered and concentrated in vacuo. Flash chromatography (hexane/AcOEt 99:1) furnished pure ester 1 (95% yield). The same conditions were employed for ester 3 using PhLi (0.1 M hexane solution).

General procedure for the synthesis of tert-butyl esters from arylbromides and HexLi and trapping with Boc₂O. Synthesis of 6a is described.

A microfluidic system composed of two T-shaped micromixers [M1 and M2], two microtubes reaction (R1, length L = 6 cm and R2 length L = 200 cm) and three pre-cooling units (P1, length L = 100 cm, P2, length L = 50 cm, and P3, length L = 100 cm) cooled at 0 °C was used (Figure 2). A solution of arylbromide 5a (0.12 M in 2-MeTHF) (flow rate: 2 mL/min) and a solution of HexLi (0.13 M in hexane) (flow rate: 2 mL/min) were introduced into M1 by syringe pumps. The resulting solution was transferred through R1 at M2 and mixed to a solution of (Boc)₂O (0.16 M in 2-MeTHF) (flow: 1.5 mL/min). The resulting solution passes through R2 with a residence time of 17.38 s. After reaching the steady state (30 s), the out-coming solution of the product was collected for 120 s in a vial containing a saturated solution of NH₄Cl. Following extraction with AcOEt (3 x 10 mL), the collected organic phase were dried over Na₂SO₄, filtered and concentrated in vacuo. Flash chromatography (hexane/AcOEt 99:1 – 90/10) furnished pure ester 6a (90% yield). Conditions reported in Table 1 were employed for bromides 5b-j.

$^a$ **Condition A.** Flow rate: Alkyne 2 mL/min; HexLi 2mL/min; Boc$_2$O 1.5 mL/min.

**Condition D.** Flow rate: Alkyne 2 mL/min; HexLi 2mL/min; Boc$_2$O 1.5 mL/min (R1 = 25 cm).
(4-Dimethylamino-phenyl)-propynoic acid tert-butyl ester 6k

(95%, 112 mg). $^1$H-NMR (400 MHz, CDCl$_3$, ppm) $\delta$ 7.45 (d, $J = 9$ Hz, 2H), 6.61 (d, $J = 9$ Hz, 2H), 3.01 (s, 6H), 1.54 (s, 9H). $^{13}$C-NMR (126 MHz): $\delta$ 154.0, 151.5, 134.8 (2C), 111.5 (2C), 105.8, 87.0, 82.9, 81.5, 40.1 (2C), 28.3 (3C). FT-IR (film, cm$^{-1}$) $\nu$ 2918, 2190, 1687, 1606, 1315, 1145, 823, 748. HMRS C$_{15}$H$_{19}$NaO$_2$ [M+Na] calculated 268.1308; found 268.1316.

tert-butyl 3-phenylpropiolate 6l

(50%, 92 mg) $^1$H-NMR (600 MHz, CDCl$_3$, ppm): $\delta$ 7.55 - 7.53 (m, 2 H), 7.41 - 7.38 (m, 1 H), 7.34 - 7.31 (m, 2 H), 1.52 (s, 9 H). $^{13}$C-NMR (150 MHz, CDCl$_3$, ppm): $\delta$ 153.1, 132.8, 130.3, 128.5, 120.0, 83.8, 83.4, 82.0, 28.0. FT-IR (film, cm$^{-1}$): $\nu$ 2982, 844.

(3,4-Dimethoxy-phenyl)-propynoic acid tert-butyl ester 6m

(75%, 94 mg) $^1$H-NMR (400 MHz, CDCl$_3$, ppm) $\delta$ 7.21 (dd, $J = 8.3$, 1.8 Hz, 1H), 7.06 (d, $J = 1.8$ Hz, 1H), 6.83 (d, $J = 8.3$ Hz, 1H), 3.90 (s, 3H), 3.87 (s, 3H), 1.54 (s, 9H). $^{13}$C-NMR (100 MHz, CDCl$_3$, ppm): $\delta$ 153.4, 151.3, 148.8, 127.2, 115.4, 112.0, 111.1, 84.8, 83.5, 81.4, 56.1 (2C), 28.2 (3C). FT-IR (KBr, cm$^{-1}$) $\nu$ 2201, 1689, 1515, 1485, 1237, 1137, 1028, 842, 820, 750. HRMS C$_{15}$H$_{18}$NaO$_4$ [M+Na] calculated 285.1097; found 285.1107.

(4-Methoxy-phenyl)-propynoic acid tert-butyl ester 6n

(70%, 78 mg) $^1$H-NMR (400 MHz, CDCl$_3$, ppm) $\delta$ 7.52 (d, $J = 8.9$ Hz, 2H), 6.87 (d, $J = 8.9$ Hz, 2H), 3.82 (s, 3H), 1.54 (s, 9H). $^{13}$C-NMR (126 MHz) $\delta$ 161.3, 153.5, 134.9(2C), 114.3 (2C), 111.8, 84.6, 83.3, 81.5, 55.4, 28.2 (3C). FT-IR (film, cm$^{-1}$) $\nu$ 2980, 2206, 1718, 1605, 1252, 1145, 833, 727. HRMS C$_{14}$H$_{16}$NaO$_4$ [M+Na] calculated 255.0992; found 255.1001.
tert-butyl 3-(thiophen-3-yl)propionate 6o

(87%, 87 mg) $^1$H-NMR (400 MHz, CDCl$_3$, ppm): $\delta$ 7.71 (dd, $J = 3.0$, 1.1 Hz, 1H), 7.30 (dd, $J = 5.0$, 3.0 Hz, 1H), 7.21 (dd, $J = 5.0$, 1.1 Hz), 1.54 (s, 9H). $^{13}$C-NMR (100 MHz): $\delta$ 153.1, 133.2, 130.1, 125.8, 119.1, 83.5, 81.9, 79.2, 28.0 (3C). FT-IR (film, cm$^{-1}$): ν 2917, 2217, 1704, 1370, 1279, 1147, 787. HRMS C$_{11}$H$_{12}$NaO$_2$S [M+Na] calculated 231.0450; found 231.0459.

(2,4,6-Trimethyl-phenyl)-propynoic acid tert-butyl ester 6p

(95%, 111 mg). $^1$H-NMR (500 MHz, CDCl$_3$, ppm): $\delta$ 6.86 (d, $J = 0.5$ Hz, 2H), 2.42 (s, 6H), 2.28 (s, 3H), 1.54 (s, 9H). $^{13}$C-NMR (126 MHz): $\delta$ 153.76, 142.38 (2C), 140.23, 127.96 (2C) 116.94, 89.68, 83.11, 82.39, 28.24 (3C), 21.61, 20.9 (2C). FT-IR (film, cm$^{-1}$): ν 2980, 2204, 1704, 1282, 1142, 848, 750, 727. HRMS C$_{16}$H$_{20}$NaO$_2$ [M+Na] calculated 267.1356; found 267.1366.
Synthesis of tetrahydroisoquinoline 8.

A microfluidic system composed of two T-shaped micromixer [M1 and M2], two microtubes reaction (R1, length L = 6 cm and R2 length L = 200 cm) and three pre-cooling units (P1, length L = 100 cm, P2, length L = 50 cm, and P3, length L = 100 cm) cooled at 0 °C was used (Table 2). A solution of isoquinoline 7 (0.12 M in 2-MeTHF) (flow rate: 2 mL/min) and a solution of HexLi (0.13 M in hexane) (flow rate: 2 mL/min) were introduced into M1 by syringe pumps. The resulting solution was transferred through R1 to M2 and mixed to a solution of (Boc)₂O (0.16 M in 2-MeTHF) (flow: 1.5 mL/min). The resulting solution passes through R2 with a residence time of 17.1 s. After reaching the steady state (30 s), the out-coming solution of the product was collected for 120 s in a vial containing a saturated solution of NH₄Cl. Following extraction with AcOEt (3 x 10 mL), the collected organic phase were dried over Na₂SO₄, filtered and concentrated in vacuo. Flash chromatography (hexane/AcOEt 70/30) furnished pure 8 (82% yield).

Figure 4

**tert-butyl 4-bromo-1-hexylisoquinoline-2(1H)-carboxylate 8**

(82%, 155 mg) ¹H-NMR (500 MHz, CDCl₃, ppm) 7.47-7.44 (m, 2H), 7.30-7.27 (m, 3H), 7.24-7.21 (m, 2H), 7.10 (s, 1H), 7.04-7.01 (m, 2H), 5.28 (t, J = 7.35 Hz, 1H), 5.11 (t, J = 6.75 Hz, 1H), 1.66-1.56 (m, 4H), 1.54 (s, 9H) 1.52 (s, 9H), 1.25-1.23 (m, 16H,) 0.88-0.83 (6H,). ¹³C-NMR (126 MHz, CDCl₃, ppm) δ 151.1, 133.3, 128.0, 127.8, 126.3, 126.3, 125.9, 124.5, 102.9, 82.1, 55.3, 35.1, 31.9, 29.2, 28.3 (3C), 25.5, 22.7, 14.2. FT-IR (film, cm⁻¹): ν 2929, 2856, 1712, 1617, 1453, 1391, 1332, 857, 761, 685. HRMS C₂₀H₂₄O₂NNaBr [M+Na]⁺ calculated 416.1196; found 416.1213.
General procedure for the synthesis of a tert-butyl ester, starting from a substituted aryliodide by an ester group through an exchange reaction with PhLi.

A microfluidic system consisting of two T-shaped micromixer [M1 and M2], two microtubes reaction (R1, L = 3.5 cm, R2, L = 100 cm) and three pre-cooling units (P1, length L = 100 cm, P2, length L = 50 cm and P3, length L = 100 cm) at -40 °C was used. A solution of ethyl 4-iodobenzoate 9 (0.12 M in THF) (flow rate: 4.5 mL/min) and a solution of PhLi (0.675 M in THF) (flow rate: 1 mL/min) were introduced into M1 by syringe pumps. The resulting solution transferred through R1 to M2 and mixed with a solution of Boc₂O (0.27 M in THF) (flow rate: 3 mL/min). The resulting solution passes through R2 with a residence time of 5.4 s. After reaching the steady state (15 s), the outcoming solution of the product was collected for 120 s in a vial containing a saturated solution of NH₄Cl. Following extraction with AcOEt (3 x 10 mL), the collected organic phase were dried over Na₂SO₄, filtered and concentrated in vacuo. Flash chromatography (hexane/AcOEt 90/10) furnished pure di-ester 10.

**Figure 5**

**tert-butyl ethyl-terephtalate 10**

(65%, 78 mg) ¹H-NMR (500 MHz, CDCl₃, ppm) δ 8.07 (d, J = 8.5 Hz, 2H), 8.03 (d, J = 8.6 Hz, 2H), 4.39 (q, J = 7.1 Hz, 2H), 1.60 (s, 9H), 1.4 (t, J = 7.1 Hz, 3H). ¹³C-NMR (126 MHz, CDCl₃, ppm) δ 166.07, 165.06, 135.83, 133.90, 129.44 (4C), 81.81, 61.47, 28.26 (3C), 14.41. FT-IR (film, cm⁻¹) ν 2980, 1716, 1368, 1247, 1164, 1119, 1019, 876, 844. HRMS C₁₄H₁₈O₄Na [M+Na⁺] calculated 273.1097; found 273.1109.
