12. NMR and Mass Spectra of TP-Mito/Ratio-SO$_2$ ..................................3
1. **Materials and Instruments**

All chemicals were obtained from commercial suppliers and used without further purification. Water used in all experiments was doubly distilled and purified via a Milli-Q water system (Millipore, USA). Stock solution (500 μM) of the probe was prepared by dissolving TP-Mito/Ratio-SO$_2$ in ethanol. NaHSO$_3$, used as a sulfur dioxide derivates source in all experiments, was dissolved in water at a concentration of 5 mM. Stock solutions of metal ions and anions were prepared from the corresponding inorganic salts. Nitric oxide (NO) was generated from DEA/NONOate (1mM stock solution in 0.01 M NaOH).

UV-Vis absorption spectra were recorded using a Hitachi U-4100 UV/Vis spectrophotometer (Kyoto, Japan) in 1 cm path length quartz cuvettes. The one-photon steady-state fluorescence emission spectra were obtained from a PTI QM4 fluorescence system (Photo Technology International, USA). Two-photon fluorescence spectra were obtained with a mode-locked Ti:sapphire pulsed laser (Chameleon Ultra II, Coherent Inc.) and then recording with a DCS200PC single photon counting (Beijing Zolix InstrumentsCo., Ltd.). $^1$H and $^{13}$C NMR spectra were recorded on a Bruker DRX-400 spectrometer (Bruker) with TMS employed as an internal standard. All chemical shifts are given in the standard δ notation of parts per million. Mass spectra were measured on LCQ Advantage ion trap mass spectrometer (Thermo Finnigan). The pH was measured with a Mettler-Toledo Delta 320 pH meter. The fluorescence images were acquired from the green channel (490-520 nm) and red channel (580-630 nm) upon two-photon excitation at 760 nm with a pulse laser by
using an Olympus FV1000 laser confocal microscope (Olympus, Japan).

2. Synthesis

![Synthetic Procedure Scheme](image)

Scheme S1. Synthetic Procedure of TP-Mito/Ratio-SO₂.

**Synthesis of Compound 1.** To a solution of 4-Fluorobenzaldehyde (250 mg, 2.0 mmol) and 1-Boc-piperidine (558.75 mg, 3.0 mmol) in DMF (3.5 mL) was added K₂CO₃ (414.6 mg, 3.0 mmol). The solution was heated at 90 °C for 30 h under N₂ atmosphere in the dark, then was added water and the resulting solution was extracted with ethyl acetate. The organic layer was separated, washed with water (20 mL), brine (20 mL). Then the organic phase was dried with Na₂SO₄, and the solvent was evaporated under reduced pressure. The residue was purified by the silica gel chromatography using Petroleum ether:ethyl acetate (4:1, v/v) as eluent to afford compound 1 as a faint yellow soild (357.1 mg, 61.5%). ¹H NMR (400MHz, CDCl₃): δ 1.40 (s, 9H), 3.29-3.31 (m, 4H), 3.49-3.52 (m, 4H), 6.82 (d, J = 8.0 Hz, 2H), 7.67 (d, J = 8.0 Hz, 2H), 7.90 (s, 1H).

**Synthesis of Compound 2.** Compound 1 (150mg, 0.52 mmol) was treated with 1,2,3,3-tetramethyl-3H-indoliumiodide (186.7 mg, 0.62 mmol) and the proper
piperidine (0.1 mL) in anhydrous ethanol (5 mL). The reaction mixture was stirred at 80°C under N2 atmosphere for 3 hours, and the solvent was removed under reduced pressure. The resulting residue was purified by column chromatography (CH2Cl2/MeOH, 20:1) on silica gel to give the product 2 as a purple solid (188.9 mg, yield: 63.7%).^1H NMR (400MHz, CDCl3): δ 1.40 (s, 9H), 1.73 (s, 6H), 3.46-3.49 (m, 8H), 4.14 (s, 3H), 6.89 (d, 2H), 7.34-7.46(m, 5H), 8.07-8.10 (m, 3H).

**Synthesis of Compound MC.** Compound 2 (188.9 mg, 0.3294 mmol) was dissolved in CH2Cl2/CF3COOH solution (4 ml, V/V = 1: 1), and the solution was stirred at room temperature for 2 h. The solution was concentrated under reduced pressure and then subjected to flash chromatography on silica (CH2Cl2:C2H5OH = 15:1), yielding compound MC as a purple solid (116.9 mg, 75%).^1H NMR (400MHz, CDCl3): δ 1.77(s, 6H), 3.27(brs, 4H), 3.75(brs, 4H), 4.06 (s, 3H), 6.89 (d, 2H), 7.17 (d, J = 8.0 Hz, 1H), 7.44 (d, J = 16.0 Hz, 1H), 7.54-7.59 (t, 3H), 7.79-7.83 (m, 2H), 8.15(d, J = 8.0 Hz, 2H), 8.35(d, J = 16.0 Hz, 1H), 9.45(s, 1H). EI-MS (m/z): calcd for C23H28N3+: 346.49; found: 346.3.

**Synthesis of TP-Mito/Ratio-SO2.** compound TP (75 mg, 0.277mmol), EDC (90 mg, 0.436 mmol) and catalytic amount DMAP were added into a solution containing compound MC (115 mg, 0.243 mmol) in CH2Cl2 (4.0mL). The mixture was stirred under N2 atmosphere for 12 h at the room temperature, and after the solvent was removed under reduced pressure, the resulting residue was purified by column chromatography (CH2Cl2/MeOH, 15:1) on silica gel to give the final product TP-Mito/Ratio-SO2 as a purple solid (140.3 mg, yield: 77.8%).^1H NMR (400MHz,
DMSO): δ 1.77 (s, 6H), 2.61 (s, 3H), 3.17-3.27 (m, 1H), 3.48-3.58 (m, 14H), 4.05 (s, 3H), 6.71 (s, 1H), 6.97 (d, J = 8.8 Hz, 1H), 7.10-7.16 (m, 1H), 7.41 (d, J = 15.6 Hz, 1H), 7.50-7.60 (m, 2H), 7.64 (d, J = 8.8 Hz, 1H), 7.77-7.82 (m, 3H), 7.88 (d, J = 8.8 Hz, 1H), 8.17 (d, J = 8.0 Hz, 2H), 8.36 (dd, J = 15.6, 5.6 Hz, 1H), 8.43 (s, 1H). ^13^C NMR (100MHz, DMSO): δ 220.01, 185.36, 175.44, 163.10, 162.79, 159.11, 158.86, 151.90, 147.93, 147.11, 142.34, 138.87, 135.79, 133.85, 133.09, 129.48, 129.22, 128.98, 127.76, 123.88, 120.89, 118.70, 112.36, 112.00, 109.57, 76.36, 72.37, 67.73, 63.11, 60.04, 56.29, 53.39, 50.95, 48.95, 38.49, 35.12, 31.46, 31.12, 28.20, 25.08. EI-MS (m/z): calcd for C_{40}H_{43}N_{4}O_{2}^{+}: 611.79; found: 611.5.

### 3. Spectrophotometric Experiments

Test solutions were prepared by mixing TP-Mito/Ratio-SO$_2$ and appropriate analyte stock into a tube and then diluting the solution to 500 μL with 10mM phosphate buffer (PB) (containing 20 % EtOH, pH 7.4). After incubation at room temperature for 10 min, the absorption or fluorescence spectra measurements were then performed. The one-photon fluorescence spectra were recorded at emission wavelength range from 450 to 650 nm with excitation wavelength of 380 nm. The two-photon fluorescence emission spectra were acquired by recording with a DCS200PC single photon counting using a mode-locked Ti:sapphire pulsed laser (exciting the samples at 760 nm).

### 4. Kinetic Studies

In kinetic studies, the apparent rate constant $k$ for the reaction of TP-Mito/Ratio-SO$_2$ with different concentrations of NaHSO$_3$ were determined by fitting the fluorescence intensity ratios to the pseudo first-order:
\[ \ln\left(\frac{[F_{500}/F_{590}]_{\text{max}} - [F_{500}/F_{590}]_t}{[F_{500}/F_{590}]_{\text{max}}}\right) = -k t^2 \]

Where \((F_{500}/F_{590})_t\) and \((F_{500}/F_{590})_{\text{max}}\) are the fluorescence intensity ratios of TP-Mito/Ratio-SO_2 at a time \(t\) and the maximum value obtained after the reaction was complete.

The observed rate constant \(k'\), contains the concentration of NaHSO_3 as a constant and is related to the second-order rate constant, \(k\) (M\(^{-1}\)s\(^{-1}\)), by equation:

\[ k' = k[\text{NaHSO}_3] \]

5. DFT Calculations

The ground state structures of TP-Mito/Ratio-SO_2 and TP-Mito/Ratio-SO_2 + NaHSO_3 were optimized using DFT with B3LYP functional and 6-31+G (d, p) basis set. The initial geometries of the compounds were generated by the GaussView software. All of these calculations were performed with Gaussian 09 (Revision A.02).

6. Measurements of One-photon Quantum Yields and Two-Photon Absorbance Cross Section

The one-photon quantum yields (QY) of samples were estimated using Rhodamine B or quinine sulfate as a reference standard, which was freshly prepared to reduce the measurement error. The quantum yield \(\Phi\) as a function solvent polarity is calculated using the following equation:

\[ \Phi_F = \Phi_{F,\text{cal}} \cdot \frac{S}{S_{\text{cal}}} \cdot \frac{A_{\text{cal}}}{A} \cdot \frac{n^2}{n_{\text{cal}}^2} \]

Where \(\Phi_F\) is the quantum yield, \(S\) is the areas’ integral values of the corrected fluorescence spectra, \(A\) stands for the absorbance and \(n\) is refractive index. The
subscript cal and no denote the standard and sample, respectively.

The two-photon absorption (TPA) cross sections ($\delta$) of samples (in the wavelength range of 690-860 nm) in neutral conditions were determined using TPE method with femtosecond Ti-sapphire laser pulses described in previous literature. The TPE fluorescence emission intensity of TP-Mito/Ratio-SO$_2$ and TP-Mito/Ratio-SO$_2$ + HSO$_3^-$ in PBS buffer (pH 7.4) was measured in the emission range of 450-620 nm under excitation at 690-840 nm using Rhodamine B as the reference, whose TP properties have been well-characterized in the previous literature. Intensities of TPE fluorescence emission of the reference and the samples emitted at the same excitation wavelength were determined. The TPA cross section was calculated as the following equation:

$$\delta_S = \frac{S_S}{S_R} \cdot \frac{\Phi_R \cdot C_R \cdot n_S}{\Phi_S \cdot C_S \cdot n_R}$$

Subscript $S$ and $R$ denote the sample and the reference, respectively. $S$ represents the intensity of TPE fluorescence emission, $\Phi$ is the fluorescence quantum yield, $C$ denotes the concentration, and $n$ represents the refractive index of the solvents.

7. Cell Incubation and Cytotoxicity Assay

HepG2 cells were cultured using high-glucose Dulbecco's modified Eagle's medium (DMEM, GIBCO) with 1% penicillin-streptomycin (10,000 U/mL, 10,000 µg mL$^{-1}$, Invitrogen) and 10% fatal bovine serum (GIBCO) in an atmosphere of 5% CO$_2$ and 95% air at 37°C.

The cellular cytotoxicity of TP-Mito/Ratio-SO$_2$ towards HepG2 cells as the model was evaluated using the standard cell viability assay - the MTT assay. HepG2 cells
were seeded into a 96-well plate at a concentration of $5\times10^3$ cells well$^{-1}$ in 100 µL of DMEM medium with 10% FBS. Plates were maintained at 37 °C in a 5% CO$_2$ 95% air incubator for 24 h. After the original medium was removed, the HepG2 cells were incubated with different concentrations of TP-Mito/Ratio-SO$_2$ (0-30 µM). The cells incubated with the culture medium only were served as the controls. The cells were washed with PBS for three times and then 100 µL MTT solution (0.5 mg mL$^{-1}$ in PBS) was added to each well. After addition of DMSO (150 µL well$^{-1}$), the assay plate was allowed to shake at room temperature for 10 min. The spectrophotometrical absorbance of the samples was measured by using a Tecan microplate (ELISA) reader. The cell viability was calculated based on measuring the UV-vis absorption at 570 nm using the following equation, where OD$_{570}$ represents the optical density:

$$\text{Cell viability} = \frac{[\text{OD}_{570}(\text{sample}) - \text{OD}_{570}(\text{blank})]}{[\text{OD}_{570}(\text{control}) - \text{OD}_{570}(\text{blank})]}$$

8. Preparation and Staining of Rat Liver Tissue Slices

Rat liver slices were prepared from the liver of 2-weeks-old rat (SD) according to the protocol No. SYXX (Xiang) 2008-0001, approved by Laboratory Animal Center of Hunan. The tissue slices were cut into 400 µm in size using a vibrating-blade microtome. The slices were cultured under different conditions, followed by incubating with TP-Mito/Ratio-SO$_2$ for 30min in the culture medium. The residual probe was removed by washing three times using PBS before the imaging by two photon confocal microscope.

9. Ratiometric TPM Imaging of SO$_2$ Derivatives in Living Cells and Tissues. For the colocalization experiment, TP-Mito/Ratio-SO$_2$ (5.0 µM) and
mitochondrial tracker MitoTracker Green FM (1.0 μM) simultaneously stained the HepG2 cells in the incubator at 37 °C with 5 % CO₂ for 30 min and then rinsed for three times with PBS. For imaging of exogenous SO₂, the cells were pretreated with TP-Mito/Ratio-SO₂ (5.0 μM) for 30 min before washed three times with PBS, then incubated with different concentrations of NaHSO₃ solution for another 30 min. In order to monitor the generation of endogenous SO₂ in mitochondria, the HepG2 cells were incubated with the probe in the absence or presence of TST substrates thiosulfate /GSH (250 μM/500 μM) for 1h. As a negative control, another group’s HepG2 cells were dealt with TST inhibitor SNAP (100 nM) for 1h before incubation of thiosulfate (250 μM) and GSH (500 μM), and then loaded with the probe for 30 min. After rinsing with PBS buffer, these cells were exposed to imaging experiment on the two photon confocal microscope. For TPM tissue imaging, the rat liver tissue slices were pre-incubated with α-lipoic acid (5 mM) for 1 day or N-ethylmaleimide (10 mM) for 1h to regulate GSH production of tissue, and then treated with TST substrates thiosulfate (2.5 mM) for 1h, followed by loading with 50 μM probe for 30min. As a negative control, another tissue slice was dealt with TST inhibitor SNAP (2.0 μM) for 1h before incubation of α-lipoic acid (5 mM) and thiosulfate (2.5 mM), and then loaded with the probe for 30 min. Procedures of imaging operations for tissue slices were similar as cellular ones. Two-photon imaging patterns were obtained from the green channel (490-520 nm) and red channel (580-630 nm) with two-photon excitation wavelength of 760 nm. The ratiometric imaging patterns were analyzed by Image J software.

11. Spectroscopic Data

**Fig. S1.** UV-vis absorption spectra (dashed lines) of MC before (a) and after addition of 200 μM NaHSO₃ (b) and two-photon emission spectra (solid lines) of 10 μM TP (c) in PB (pH = 7.4, containing 20% EtOH). (λₑₓ = 760 nm).

**Fig. S2.** Frontier molecular orbital plots of TP-Mito/Ratio-SO₂ (A) and TP-Mito/Ratio-SO₂ + NaHSO₃ (B).

For TP-Mito/Ratio-SO₂, the HOMO-LUMO energy gap of the merocyanine moiety (ΔE = 0.98 eV) is less than that of the acedan moiety (ΔE = 1.48 eV), facilitating the intramolecular energy transfer from acedan to merocyanine. However, after treatment with NaHSO₃, both of the HOMO and LUMO show that the π electrons are not located around the whole acceptor moiety, indicating that the π-conjunction structure of merocyanine is destroyed, moreover, its energy gap (ΔE = 1.61 eV) is greater than that of the energy donor (ΔE = 1.45 eV), thus the FRET process would be suppressed.
