## General Information

Chemicals were obtained from Sigma-Aldrich, Fischer Scientific, Alfa Aesar, Fluka or Fluorochem and were used as received unless otherwise stated. Air/moisture sensitive reactions were carried out in oven-dried ( $140^{\circ} \mathrm{C}$ ) or flame-dried glassware and assembled while hot under a positive pressure of nitrogen. Reactions were carried out under an atmosphere of nitrogen unless otherwise stated.

Thin-layer chromatography (TLC) was performed using glass plates coated with silica gel (with fluorescent indicator $\mathrm{UV}_{254}$ ). Developed plates were air-dried and analysed under a UV lamp (254/365 nm) unless otherwise stated. Flash chromatography was performed using silica gel (40-63 $\mu \mathrm{m}$ ). Melting points were recorded in open capillaries using an Electrothermal 9100 melting point apparatus. Values are quoted to the nearest $1{ }^{\circ} \mathrm{C}$ and are uncorrected. Infrared spectra were recorded on either a Perkin Elmer Paragon 1000 FT spectrometer or a Shimadzu IRAffinity-1S FT spectrometer equipped with an ATR attachment. Absorption maxima are reported in wavenumbers $\left(\mathrm{cm}^{-1}\right)$. Mass spectrometry data were acquired through the University of St Andrews School of Chemistry mass spectrometry service or through the EPSRC national mass spectrometry service centre (Swansea, UK)

Nuclear magnetic resonance (NMR) spectra were recorded on a Brüker Advance $500\left({ }^{1} \mathrm{H}\right.$, 500 ; $\left.{ }^{13} \mathrm{C} 126 \mathrm{MHz}\right)$, a Brüker Advance $400\left({ }^{1} \mathrm{H}, 400 ;{ }^{13} \mathrm{C}, 100 \mathrm{MHz}\right)$ or a Brüker Advance 300 $\left({ }^{1} \mathrm{H} 300 ;{ }^{13} \mathrm{C}, 75 \mathrm{MHz}\right.$ ) spectrometer. ${ }^{13} \mathrm{C}$ NMR spectra were recorded using the PENDANT pulse sequence. All NMR spectra were acquired using deuterated solvents and the lock and the residual solvent as the internal standard. Chemical shifts are reported as $\delta$ values in units parts per million (ppm). Proton-proton coupling constants (J) are quoted in Hz to the nearest 0.1 Hz . Multiplicities are reported as singlet ( s ), doublet (d), triplet ( t ), quartet ( q ), quintet (quin), multiplet (m), broad (br) or some combination of these i.e. doublet of triplets (dt). NM-R data was analysed using TopSpin or MestReNova NMR processor software.

Optical rotations were measured using a PerkinElmer Model 341 polarimeter using the sodium D line at $20^{\circ} \mathrm{C}$. Units for $[\alpha]$ are degcm $\mathrm{g}^{-1} \mathrm{dm}^{-1}$ and c is $\mathrm{g} \mathrm{cm}^{-3}$.

## General experimental procedures

## General Procedure A

To a stirred solution of methyl indole-3-carboxylate (1 eq.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0{ }^{\circ} \mathrm{C}$ was added N chlorosuccinimide ( 1.1 eq.) and $N, N^{\prime}$-dimethylpiperazine ( 0.55 eq.). After 2 hours, a mixture of trichloroacetic acid ( 0.25 eq.) and the appropriate amine ( 2 eq .) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added. After a further 2 hours, the reaction mixture was warmed to room temperature and washed with $10 \%$ aq. $\mathrm{NaHCO}_{3}$ aq. $\mathrm{HCl}(1.0 \mathrm{M})$, water and brine. The organic layer was dried using $\mathrm{MgSO}_{4}$, concentrated in vacuo and purified by recrystallization from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexane.

## General Procedure B

A stirred suspension of the appropriate indole-3-carboxylate in $\mathrm{Ph}_{2} \mathrm{O}$ was heated at reflux for 2.5 hours whilst removing the methanol that was formed during the reaction by distillation. After cooling, the resulting precipitate was collected by filtration and washed with $\mathrm{Et}_{2} \mathrm{O}$ and dried in vacuo to afford the appropriate indoloquinoline.

## General Procedure C

A stirred suspension of the appropriate indoloquinoline (1 eq.) in $\mathrm{POCl}_{3}$ ( 35 eq .) was refluxed for 2 hours. After cooling to room temperature, the reaction was concentrated in vacuo. The residue was added to an ice-water mixture and basified (to $\sim \mathrm{pH} 9$ ) by careful addition of sat. aq. $\mathrm{NaHCO}_{3}$ solution. The initially yellow residue turned orange and then the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic phases were dried using $\mathrm{MgSO}_{4}$ and concentrated in vacuo to afford the appropriate crude chloro compound.

## General procedure D

To a stirred suspension of sodium (3 eq.) in THF was added allyl alcohol ( 5.7 eq.) over the course of 0.5 hours. The mixture was left to stir for 3 hours before being added via cannula addition to a stirred suspension of the appropriate chloro compound (1 eq.) in THF. After 18
hours the reaction was quenched with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}$. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the combined organic extracts were washed with water, brine, dried using $\mathrm{MgSO}_{4}$ and concentrated in vacuo. Purification by recrystallisation of the resulting solid from EtOAc afforded allyl ether compound.

## General Procedure E

A stirred solution of the appropriate allyl ether (1 eq.) in PhMe was refluxed for 1 hour. The reaction mixture was concentrated in vacuo and the resulting solid purified by recrystallisation from EtOAc to give the appropriate allyl ketone.

## Experimental Procedures for the Synthesis of the tetracyclic core of S1 from 7 and 8

The route used to prepare $\mathbf{S 1}$ followed our previously reported synthesis of the $\mathrm{N}-\mathrm{Me}$ analogue of S1. ${ }^{1}$

Methyl 2-(benzyl(phenyl)amino)-1H-indole-3-carboxylate (9)

Following general procedure A. To a stirred solution of methyl indole-3-carboxylate (7) (15.0 g, 85.7 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(170 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added $N$-chlorosuccinimide ( $12.6 \mathrm{~g}, 94.3 \mathrm{mmol}$, 1.1 eq.) and $N, N$ '-dimethylpiperazine ( $5.37 \mathrm{~g}, 6.4 \mathrm{~mL}, 47.1 \mathrm{mmol}, 0.55$ eq.). After 2 hours, a mixture of trichloroacetic acid ( $3.42 \mathrm{~g}, 21.4 \mathrm{mmol} 0.25 \mathrm{eq}$.) and N -benzylaniline (8) ( 31.4 g , $29.7 \mathrm{~mL}, 171.4 \mathrm{mmol}, 2$ eq.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(170 \mathrm{~mL})$ was added. After a further 2 hours, the reaction mixture was warmed to room temperature and washed with $10 \%$ aq. $\mathrm{NaHCO}_{3}(1 \times$ $150 \mathrm{~mL})$, aq. $\mathrm{HCl}(1 \times 150 \mathrm{~mL}, 1.0 \mathrm{M})$, water ( $1 \times 150 \mathrm{~mL}$ ) and brine ( $1 \times 150 \mathrm{~mL}$ ). The organic layer was dried using $\mathrm{MgSO}_{4}$, concentrated in vacuo and purified by recrystallisation from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexane to afford $9(29.9 \mathrm{~g}, 84.0 \mathrm{mmol}, 98 \%)$ as an off-white solid.

## 5-Benzyl-5,6-dihydro-11H-indolo[2,3-b]quinolin-11-one (S1)

Following general procedure B. A stirred suspension of 9 ( $25.0 \mathrm{~g}, 70.2 \mathrm{mmol}$ ) in $\mathrm{Ph}_{2} \mathrm{O}(140$ mL ) was heated at reflux for 2.5 hours whilst removing the methanol that was formed during the reaction by distillation. After cooling, the resulting precipitate was collected by filtration and washed with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50 \mathrm{ml})$ and dried in vacuo to afford $\mathbf{S 1}(18.0 \mathrm{~g}, 55.4$ mmol, 79\%) as a beige solid.

## Synthesis of Analogues of S1 and 6 with alternative $N$-protecting groups

Initial studies also focused on the attempted preparation of a derivative of $\mathbf{S 1}$ that was N protected by a p-methoxybenzyl (PMB) group rather a benzyl group. $N-(p-$ methoxybenzyl)aniline (S2) was synthesised in good yield by the sodium borohydride reduction of the corresponding, commercially available, imine $\mathbf{S 3}$ (Scheme S1A). ${ }^{2}$ Subsequent conversion of $\mathbf{S} \mathbf{2}$ to $\mathbf{S 4}$ was achieved in an analogous manner to the preparation of 9 in $85 \%$ yield (Scheme S1B). However, a clean transformation of S4 to S5 could not be achieved with mixtures of compounds resulting. The ${ }^{1} \mathrm{H}$ NMR spectrum associated with the crude reaction mixture showed features consistent with loss of the PMB group: two NH signals were present at 12.30 ppm and 11.65 ppm and only traces of the signals associated with the benzyl protons of the PMB group were present. It was therefore concluded that the PMB protecting group was incompatible with the high temperatures involved in this synthetic route.

An alternative route to $\mathbf{S} \mathbf{5}$ was therefore attempted using the approach shown in Scheme S1C. After preparation of S6 (see experimental below), alkylation of S6 led to the formation of S5 although purification was not carried out and the crude S5 was converted directly to the chloride S7 which was purified by flash column chromatography. Subsequent conversion of S7 to S8 (Scheme S1C), the precursor to the [3,3]-Claisen rearrangement in the PMB series was followed by conversion to the $N$-PMB protected analogue $\mathbf{S 9} 9$ of $N$-benzyl protected ketone 6 that was used here. This protocol was also applied to the preparation of N-3,4-dimethoxybenzyl protected ketone S13 (via the analogous S10, S11 and S12). Whilst ketones S9 and S13 were not used in the reported synthesis of ( $\pm$ )-dehaloperophoramidine (2), it seems likely that much of the chemistry in subsequent steps is applicable to these potentially easier to deprotect substrates.

## Preparation of $\boldsymbol{N}$-( $\boldsymbol{p}$-methoxybenzyl)aniline (S2) ${ }^{2}$

$\mathrm{NaBH}_{4}(3.78 \mathrm{~g}, 100 \mathrm{mmol})$ was added to a stirred solution of $(E)-\mathrm{N}-[(4-$ methoxyphenyl)methylene]benzenamine (S3) and MeOH (80 ml). After 12 hours, water (20 ml ) was added and the MeOH was evaporated at reduced pressure. The aqueous residue was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{ml})$. The $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ extracts were combined, dried $\left(\mathrm{MgSO}_{4}\right)$, and the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was evaporated in vacuo. The residue was crystallised from hexane to afford
the title compound $\mathbf{S 2}$ as colourless crystals ( $5.00 \mathrm{~g}, 23.5 \mathrm{mmol}, 93 \%$ ). Spectroscopic data was in accordance with that published in the literature. ${ }^{2}$ m.p. $58-60{ }^{\circ} \mathrm{C}\left(\right.$ lit. ${ }^{2} 61-62{ }^{\circ} \mathrm{C}$ ); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.27-7.32(\mathrm{~m}, 2 \mathrm{H}), 7.14-7.21(\mathrm{~m}, 2 \mathrm{H}), 6.86-6.91(\mathrm{~m}, 2 \mathrm{H}), 6.72(\mathrm{tt}, \mathrm{J}=$ $7.2,1.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.62(\mathrm{~m}, 2 \mathrm{H}), 4.25(\mathrm{~s}, 2 \mathrm{H}), 3.94(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H})$.

## Preparation of 2-[(4-methoxybenzyl)phenylamino]-1H-indole-3-carboxylic acid methyl ester (S4)

Prepared from indole-3-carboxilic acid methyl ester (7) ( $1.88 \mathrm{~g}, 10.8 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{ml})$ and $N$-(p-methoxybenzy) aniline (S2) ( $4.59 \mathrm{~g}, 21.5 \mathrm{mmol}$ ) using general procedure $\mathbf{A}$.

The crude product was purified by flash chromatography ( $5 \%$ to $10 \% \mathrm{EtOAc} / \mathrm{hexane}$ ) to afford the title compound $\mathbf{S 4}$ as colourless crystalline solid ( $3.54 \mathrm{~g}, 9.16 \mathrm{mmol}, 85 \%$ ). m.p. 158-159 ${ }^{\circ} \mathrm{C}$; IR (KBr) $\mathbf{V}_{\text {max }}$ : 3284, 2949, 1668, 1560, $1542 \mathrm{~cm}^{-1}$; HRMS (CI) $\mathrm{m} / \mathrm{z}$ calcd. for $\mathrm{C}_{24} \mathrm{H}_{23} \mathrm{~N}_{2} \mathrm{O}_{3}{ }^{+} 387.1709[\mathrm{M}+\mathrm{H}]^{+}$, found 387.1705 ; ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.33(\mathrm{~s}, 1 \mathrm{H})$, 8.11-8.15 (m, 1H), 7.15-7.25 (m, 7H), 6.77-6.90 (m, 5H), 5.04 (s, 2H), 3.78 (s, 3H), $3.73(\mathrm{~s}$, 3H); ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 164.8,158.8,147.3,132.1,130.8,129.4$ (2C), 128.3 (2C), 126.8, 122.9, 122.1, 121.7, 120.9, 117.1 (2C), 114.2 (2C), 110.7, 98.7, 56.0, 55.4, 51.1.

## Preparation of 5,6-dihydroindolo[2,3-b]quinolin-11-one (S6) ${ }^{3}$

2-phenylamino-1H-indole-3-carboxylic acid methyl ester (S14) was prepared from commercially available indole-3-carboxilic acid methyl ester ( $25.9 \mathrm{~g}, 148 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 600 ml ) and aniline ( $26.9 \mathrm{ml}, 295 \mathrm{mmol}$ ) using general procedure $\mathbf{A}$ (see above). The crude product was crystallised twice from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexane to afford the title compound $\mathbf{S 1 4}$ as pale yellow crystals ( $19.8 \mathrm{~g}, 74.4 \mathrm{mmol}, 50 \%$ ). Spectroscopic data was in accordance with that published in the literature. ${ }^{3}$
m.p. $121-122{ }^{\circ} \mathrm{C}\left(\right.$ lit. $\left.^{3} 121-122^{\circ} \mathrm{C}\right) ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.01(\mathrm{~s}, 1 \mathrm{H}), 8.22(\mathrm{~s}, 1 \mathrm{H})$, 7.46-7.38 (m, 2H), 7.80 (d, J = 7.7, 1H), 7.30-7.24 (m, 2H), 7.22-7.10 (m, 3H), 7.08-7.03 (m, 1H), 3.93 (s, 3H).
$\mathbf{S} 6$ was then prepared from $\mathbf{S 1 4}(17.5 \mathrm{~g}, 65.7 \mathrm{mmol})$ in $\mathrm{Ph}_{2} \mathrm{O}(90 \mathrm{ml})$ with a reaction time of 3.5 hours using general procedure $\mathbf{B}$.

The title compound $\mathbf{S 6}$ was obtained as a light brown solid ( $14.6 \mathrm{~g}, 62.3 \mathrm{mmol}, 95 \%$ ). Spectroscopic data was in accordance with that published in the literature. ${ }^{3} \mathrm{~m} . \mathrm{p}>400^{\circ} \mathrm{C}$ (lit. ${ }^{3}>360^{\circ} \mathrm{C}$ ); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{DMSO}_{6}$ ) $\delta 11.95(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 8.29(\mathrm{~d}, \mathrm{~J}=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.19$ (d, J = 7.9 Hz, 1H), 7.63-7.58 (m, 1H), 7.48-7.42 (m, 1H), 7.15-7.31 (m, 3H); ${ }^{13} \mathrm{C}$ NMR ( 75 MHz , DMSO-d ${ }_{6}$ ) $\delta 172.7,145.7,138.7,135.4,131.1,125.7,124.2,123.9,123.0,121.8,121.2$, 120.4, 117.8, 111.3, 102.2.

## Preparation of 11-chloro-5-(p-methoxybenzyl)-5H-indolo[2,3-b]quinoline (S7) - prepared from S6 via S5 (Scheme S1C)

Sodium hydride ( 80 mg of a $60 \%$ dispersion in oil, 2.00 mmol ) was added to a stirred suspension of 5,6-dihydroindolo[2,3-b]quinolin-11-one (S6) (469 mg, 2.00 mmol ) in THF (30 $\mathrm{ml})$, maintained under an argon atmosphere. When effervescence ceased, $p$-methoxybenzyl chloride ( $0.4 \mathrm{ml}, 3.00 \mathrm{mmol}$ ) and tetrabutyl ammonium iodide ( $222 \mathrm{mg}, 0.601 \mathrm{mmol}$ ) were added and the reaction mixture was stirred at room temperature for 4 days. $\mathrm{NH}_{4} \mathrm{Cl}_{\text {(aq) }}(20$ $\mathrm{ml})$ was added and the THF was evaporated at reduced pressure. The residue was collected by filtration and washed with water ( 50 ml ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{ml})$ to afford crude 5,6-dihydro-5-(p-methoxybenzyl)indolo[2,3-b]quinolin-11-one (S5) as a colourless solid (420 mg). A portion of crude $\mathbf{S 5}(150 \mathrm{mg})$ and $\mathrm{POCl}_{3}(4 \mathrm{ml})$ were heated at reflux for 1.5 hours, under an argon atmosphere according to general procedure $\mathbf{C}$. After cooling the reaction mixture to room temperature, the excess $\mathrm{POCl}_{3}$ was evaporated at reduced pressure and $\mathrm{NaHCO}_{3(\mathrm{aq})}$ ( 150 ml ) was added to the residue. The aqueous suspension was then extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 70 \mathrm{ml}$ ). The $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ extracts were combined, dried $\left(\mathrm{MgSO}_{4}\right)$ and the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was evaporated at reduced pressure. The residue was purified by flash chromatography (60\% to $100 \%$ EtOAc/hexane) to afford the title compound S7 as a bright orange solid (120 mg, $0.322 \mathrm{mmol}, 76 \%)$.

## Preparation of 11-allyloxy-5-(p-methoxybenzyl)-5H-indolo[2,3-b]quinoline (S8)

Prepared from 11-chloro-5-(p-methoxybenzyl)-5H-indolo[2,3-b]quinoline (S7) (110 mg, 0.300 mmol ) in THF ( 5 ml ), with the alkoxide generated from allyl alcohol ( $0.70 \mathrm{ml}, 10.5$ mmol ) and sodium ( $35 \mathrm{mg}, 1.50 \mathrm{mmol}$ ) in THF ( 5 ml ), using general procedure $\mathbf{D}$.

In this case, the crude product was purified by flash chromatograph $(60 \% \rightarrow 80 \%$ EtOAc/hexane) to afford the title compound $\mathbf{S 8}$ as a dark yellow solid ( $110 \mathrm{~g}, 0.279 \mathrm{mmol}$, 93\%).

prepared using

The required 3,4-dimethoxybenzyl bromide (S15) ${ }^{4}$ was prepared as follows: A solution of $\mathrm{PBr}_{3}(6.29 \mathrm{ml}, 66.6 \mathrm{mmol})$ and $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{ml})$ was slowly added to a stirred solution of commercially available 3,4-dimethoxybenzyl alcohol ( $5.63 \mathrm{~g}, 33.5 \mathrm{mmol}$ ) in $\mathrm{Et}_{2} \mathrm{O}(50 \mathrm{ml})$ at 0 ${ }^{\circ} \mathrm{C}$, maintained under an argon atmosphere. The reaction mixture was allowed to warm to room temperature and, after 12 hours, water ( 100 ml ) was cautiously added. When the vigorous reaction had subsided, the $\mathrm{Et}_{2} \mathrm{O}$ was separated and the aqueous phase was further extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50 \mathrm{ml})$. The $\mathrm{Et}_{2} \mathrm{O}$ extracts were combined, dried $\left(\mathrm{MgSO}_{4}\right)$ and the $\mathrm{Et}_{2} \mathrm{O}$ was evaporated at reduced pressure. The residue was crystallised from $\mathrm{EtOAc} / \mathrm{hexane}$ to afford the title compound S15 as colourless crystals ( $4.72 \mathrm{~g}, 20.4 \mathrm{mmol}, 61 \%$ ) Spectroscopic data was in accordance with that published in the literature. ${ }^{5}$
m.p. $47-49^{\circ} \mathrm{C}\left(\mathrm{lit} .{ }^{5} 50-51{ }^{\circ} \mathrm{C}\right) ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.96(\mathrm{dd}, J=8.2,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.91$ (d, J = 2.0 Hz), $6.81(\mathrm{~d}, \mathrm{~J}=8.2 \mathrm{~Hz}), 4.51(\mathrm{~s}, 2 \mathrm{H}), 3.90(\mathrm{~s}, 3 \mathrm{H}), 3.88(\mathrm{~s}, 3 \mathrm{H})$.

Sodium hydride ( 205 mg of a $60 \%$ dispersion in oil, 5.12 mmol ) was added to a stirred suspension of 5,6-dihydroindolo[2,3-b]quinolin-11-one (S6) (1.00 g, 4.27 mmol ) in THF ( 30 ml ), maintained under an argon atmosphere. When effervescence ceased, a solution of 3,4dimethoxybenzyl bromide (S15) ( $1.48 \mathrm{~g}, 6.40 \mathrm{mmol}$ ) and THF ( 5 ml ) was added and the reaction mixture was stirred at room temperature for 24 hours. $\mathrm{NH}_{4} \mathrm{Cl}_{\text {(aq) }}(5 \mathrm{ml})$ was added and the THF was evaporated at reduced pressure. The residue was washed with water and was then, after decanting the water, pulverised under $\mathrm{Et}_{2} \mathrm{O}$ until a fine powder resulted. The product was collected by filtration and washed with $\mathrm{Et}_{2} \mathrm{O}$ to afford crude 5,6-dihydro-5-(3,4-dimethoxybenzyl)indolo[2,3-b]quinolin-11-one (S10) as a light brown solid ( 1.50 g ). A portion of crude $\mathbf{S 1 0}(500 \mathrm{mg})$ and $\mathrm{POCl}_{3}(5 \mathrm{ml})$ were heated at reflux for 1.5 hours, under an argon atmosphere. After allowing the reaction mixture to cool to room temperature, the
excess $\mathrm{POCl}_{3}$ was evaporated at reduced pressure and $\mathrm{NaHCO}_{3(\mathrm{aq)}}(30 \mathrm{ml})$ was added to the residue. The aqueous suspension was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 30 \mathrm{ml})$. The $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ extracts were combined, dried $\left(\mathrm{MgSO}_{4}\right)$ and the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was evaporated at reduced pressure. The residue was purified by flash chromatography ( $80 \%$ to $100 \% \mathrm{EtOAc}$ ) to afford the title compound S11 as a bright orange solid ( $340 \mathrm{mg}, 0.844 \mathrm{mmol}, 59 \%$ ).

## Experimental Procedures for the Synthesis of 6 from S1

## 5-Benzyl-11-chloro-5H-indolo[2,3-b]quinoline (10)

Following general procedure $\mathbf{C}$. A stirred suspension of $\mathbf{S 1}(15.0 \mathrm{~g}, 46.3 \mathrm{mmol})$ in $\mathrm{POCl}_{3}$ ( $247.5 \mathrm{~g}, 150 \mathrm{~mL}, 1609 \mathrm{mmol}, 35 \mathrm{eq}$.) and was refluxed for 2 hours. After cooling to room temperature, the reaction was concentrated in vacuo. The residue was added to an ice-
water mixture and basified (to $\sim \mathrm{pH} 9$ ) by careful addition of sat. aq. $\mathrm{NaHCO}_{3}$ solution. The initially yellow residue turned orange and then the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(5 \times 50 \mathrm{~mL}\right.$ ). The combined organic phases were dried using $\mathrm{MgSO}_{4}$ and concentrated in vacuo to afford crude $\mathbf{1 0}$ ( $15.1 \mathrm{~g}, 44.0 \mathrm{mmol}, 95 \%$ ) as a red solid. Chloride $\mathbf{1 0}$ was used without further purification.

## Methyl 2-(benzyl(phenyl)amino)-1H-indole-3-carboxylate (9)

To a stirred solution of methyl indole-3-carboxylate (7) (99.8 g, $570 \mathrm{mmol}, 1$ eq.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 950 mL ) at $0{ }^{\circ} \mathrm{C}$ was added N -chlorosuccinimide ( $\left.83.7 \mathrm{~g}, 627 \mathrm{mmol}, 1.1 \mathrm{eq}.\right)$ and $\mathrm{N}, \mathrm{N}^{\prime}$ dimethylpiperazine ( $35.76 \mathrm{~g}, 42.4 \mathrm{~mL}, 313 \mathrm{mmol}, 0.55 \mathrm{eq}$.$) . After 2 \mathrm{hrs}, \mathrm{a}$ mixture of trichloroacetic acid ( $24.51 \mathrm{~g}, 150 \mathrm{mmol} 0.25 \mathrm{eq}$.) and $N$-benzylaniline (8) ( $191 \mathrm{~g}, 178.7 \mathrm{~mL}$, 1042 mmol, 2 eq.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(950 \mathrm{~mL}$ ) was added. After 2 hrs , the reaction mixture was warmed to RT and sequentially washed with $10 \%$ aq. $\mathrm{NaHCO}_{3}(950 \mathrm{~mL})$, aq. $\mathrm{HCl}(950 \mathrm{~mL}, 1.0$ M), water ( 950 mL ) and brine ( 950 mL ). The organic layer was dried using $\mathrm{MgSO}_{4}$, concentrated in vacuo and purified by recrystallization from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ / hexane to afford 9 (197 g, $553 \mathrm{mmol}, 97 \%$ ) as an off-white solid. ${ }^{1} \mathrm{H}$ NMR spectroscopic data was consistent with previously reported data for 9 .

## 5-Benzyl-5,6-dihydro-11H-indolo[2,3-b]quinolin-11-one (S1)

A stirred suspension of $9(99.8 \mathrm{~g}, 280 \mathrm{mmol})$ in $\mathrm{Ph}_{2} \mathrm{O}(560 \mathrm{~mL})$ was heated at reflux for 3 hrs while removing the methanol that is formed during the reaction by distillation. The precipitate was collected by filtration and washed with $\mathrm{Et}_{2} \mathrm{O}$ and dried in vacuo to afford $\mathbf{S 1}$ ( $74 \mathrm{~g}, 228 \mathrm{mmol}, 81 \%$ ) as a beige solid. ${ }^{1} \mathrm{H}$ NMR spectroscopic data was consistent with previously reported data for $\mathbf{S 1}$.

## 5-Benzyl-11-chloro-5H-indolo[2,3-b]quinoline (10)

A stirred suspension of $\mathbf{S 1}\left(70.0 \mathrm{~g}, 216 \mathrm{mmol}, 1 \mathrm{eq}\right.$.) in $\mathrm{POCl}_{3}(329.6 \mathrm{~g}, 200 \mathrm{~mL}, 2150 \mathrm{mmol}$, 10 eq.) and toluene ( 230 mL ) was refluxed for 2 hrs . After cooling to RT, the reaction was concentrated in vacuo. The residue was added to an ice-water mixture and basified ( $\sim \mathrm{pH} 9$ ) by careful addition of sat. aq. $\mathrm{NaHCO}_{3}$ solution. The yellow residue turned orange and then the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \times 250 \mathrm{~mL})$. The combined organic phases were dried using $\mathrm{MgSO}_{4}$ and concentrated in vacuo to afford crude 10 ( $69.5 \mathrm{~g}, 202 \mathrm{mmol}$, $94 \%$ ) as an orange solid. Chloride 10 was used without further purification. ${ }^{1} \mathrm{H}$ NMR spectroscopic data was consistent with previously reported data for 10.

## 11-(Allyloxy)-5-benzyl-5H-indolo[2,3-b]quinoline (11)

To a stirred suspension of sodium ( $13.7 \mathrm{~g}, 597 \mathrm{mmol}, 3 \mathrm{eq}$.) in THF ( 50 mL ) was added allyl alcohol ( $65.8 \mathrm{~g}, 77 \mathrm{~mL}, 1133 \mathrm{mmol}, 5.7 \mathrm{eq}$.) over the course of 0.5 hrs . The mixture was left to stir for 3 hr before adding to stirred suspension of 10 ( $68.5 \mathrm{~g}, 199 \mathrm{mmol}, 1 \mathrm{eq}$.) in THF ( 1000 mL ) via cannula addition. After 24 hrs , the reaction was quenched with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}$ $(200 \mathrm{~mL})$ and concentrated ( $\sim 500 \mathrm{~mL}$ ) in vacuo. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}-$ $2(3 \times 300 \mathrm{~mL})$ and the combined organic extracts were washed with water ( 200 mL ), brine ( 200 mL ), dried using $\mathrm{MgSO}_{4}$ and concentrated in vacuo. Purification by recrystallisation from EtOAc afforded 11 as a yellow/orange solid ( $71.1 \mathrm{~g}, 195 \mathrm{mmol}, 98 \%$ ). ${ }^{1} \mathrm{H}$ NMR spectroscopic data was consistent with previously reported data for 11.

## ( $\pm$ )-10b-Allyl-5-benzyl-5,10b-dihydro-11H-indolo[2,3-b]quinolin-11-one (6)

A stirred solution of $11(71.1 \mathrm{~g}, 195.3 \mathrm{mmol})$ in $\mathrm{PhMe}(400 \mathrm{~mL})$ was refluxed for 1 hr . The reaction mixture was concentrated in vacuo. Purification by recrystallisation from EtOAc afforded 6 ( $62.6 \mathrm{~g}, 171.9 \mathrm{mmol}, 88 \%$ ) as a yellow crystalline solid. ${ }^{1} \mathrm{H}$ NMR spectroscopic data was consistent with previously reported data for 6.

## Experimental procedures for the resolution of ketone 6

To a stirred solution of $6(3.50 \mathrm{~g}, 9.61 \mathrm{mmol}, 1 \mathrm{eq}$.$) and \mathrm{Ti}(\mathrm{OEt})_{4}(30.2 \mathrm{~mL}, 32.9 \mathrm{~g}, 144.2$ mmol, 15 eq.) in toluene ( 32 mL ) was added ( $R$ )-tert-butanesulfinamide (12) ( $11.7 \mathrm{~g}, 96.1$ $\mathrm{mmol}, 10 \mathrm{eq}$.$) . The mixture was heated to 85{ }^{\circ} \mathrm{C}$ for 9 hours before cooling to room temperature. The reaction mixture was diluted with EtOAc ( 200 mL ) and quenched with brine ( 100 mL ). The thick yellow/ orange gel was filtered through a Celite ${ }^{\circledR}$ pad and washed thoroughly with EtOAc until no yellow/orange colour remained on the filter cake. The filtrate was washed with brine ( $3 \times 250 \mathrm{~mL}$ ) before extracting from the aqueous liquid with EtOAc ( $3 \times 250 \mathrm{~mL}$ ). The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to afford a crude mixture. Purification on silica ( 5 to 50\% EtOAc: Hexane) afforded 13 ( $1.52 \mathrm{~g}, 3.27 \mathrm{mmol}, 34 \%$ ) and 14 ( $1.81 \mathrm{~g}, 3.88 \mathrm{mmol}, 40 \%$ ) as yellow amorphous solids. Starting material 6 ( $385 \mathrm{mg}, 1.06 \mathrm{mmol}, 11 \%$ ) was also recovered from the reaction.

## Assignment of the relative stereochemistry of 16

Scheme S2: Diastereoselective synthesis of epoxide 16 from 6. The relative stereochemistry of $\mathbf{1 6}$ was inferred from that assigned to the related compound $\mathbf{S 1 6}$ whose structure was assigned by small molecule X-ray crystallographic analysis (representation of analysis of S16 is shown).

Epoxide 16 was synthesised via a modified Corey-Chaykovsky reaction ${ }^{7}$ and isolated as a single diastereoisomer. The relative stereochemistry of 16 was determined by comparison of the analytical data associated with 16 with that of a compound S16 previously synthesised from S17 ${ }^{1}$ in our laboratory (see Scheme S2 and experimental protocol below). The relative stereochemistry of S16 was confirmed by small molecule X-ray crystallographic analysis (CCDC 1478153). ${ }^{6}$ One explanation for the observed relative stereochemistry of S16 is that the lithiated species $\mathbf{S 1 8}$, formed in-situ via Li-halogen exchange, attacks the carbonyl group in $\mathbf{S 1 7}$ (or 6 in the case of the formation of 16) from the opposite face to the allyl group at C10b (more accessible face) to give intermediate S19 en route to S16. Figure S1 and Table S1 show a comparison of the key signals in the ${ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{S 1 6}$ and 16.

Figure S1: ${ }^{1} \mathrm{H}$ NMR analysis of epoxides S16 and 16 emphasising the strong similarity between the spectra and hence presumably the structures.

## Preparation of ( $\pm$ )-(10bS,11S)-10b-allyl-5-methyl-5,11-dihydro-10bH-indolo[2,5-b]quinolin-

 11-spiro-2'-oxirane (S16)MeLi-LiBr ( 15.0 ml of a 1.5 M solution, 22.5 mmol ) was slowly added, over a period of 20 minutes, to a mixture of 5,10b-dihydro-10b-allyl-5-methyl-10bH-indolo[2,3-b]quinolin-11one (S17) ${ }^{1}$ ( $5.40 \mathrm{~g}, 18.7 \mathrm{mmol}$ ), chloroiodomethane ( $1.70 \mathrm{ml}, 23.9 \mathrm{mmol}$ ) and THF ( 75 ml ) at $-78^{\circ} \mathrm{C}$, maintained under an argon atmosphere. After 0.5 hours, the reaction mixture was allowed to warm the room temperature and stirring was continued for 12 hours. $\mathrm{NH}_{4} \mathrm{Cl}_{(\mathrm{aq})}$ was added and the solvent was evaporated at reduced pressure. Water ( 40 ml ) and $\mathrm{Et}_{2} \mathrm{O}$ $(40 \mathrm{ml})$ were added to the residue. The $\mathrm{Et}_{2} \mathrm{O}$ was separated and the aqueous phase was further extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 40 \mathrm{ml})$. The combined $\mathrm{Et}_{2} \mathrm{O}$ extracts were dried $\left(\mathrm{MgSO}_{4}\right)$ and filtered through a plug of silica. The $\mathrm{Et}_{2} \mathrm{O}$ solution of the crude product was then placed in an open flask and allowed to slowly evaporate at ambient temperature and pressure until nearly dry ( $c a .10 \mathrm{ml} \mathrm{Et}_{2} \mathrm{O}$ remaining). There was thus obtained the title compound $\mathbf{S 1 6}$ as large colourless crystals ( $4.98 \mathrm{~g}, 16.5 \mathrm{mmol}, 88 \%$ ). Crystals from $\mathrm{Et}_{2} \mathrm{O}$ were suitable for X -ray analysis (CCDC 1478153). ${ }^{6}$

## Rationalisation of the observed stereochemical outcome in the conversion of 16 to 5

Coordination of $\mathrm{TiCl}_{4}$ to the oxygen of the epoxide 16 likely gives rise to the iminium intermediate S20, which was susceptible to allylsilylation at C11. The approach of the electrophile was from the opposite face to the C10b allyl substituent as previously observed in the conversion of 6 to 16 (Scheme S2). The cationic intermediate S21 was stabilised by the $\beta$-silicon atom and gave rise to the desired alcohol 5 upon quenching the reaction with methanol.

Scheme S3: Proposed mechanism for the allylsilylation of epoxide 16 to alcohol 5. The stereochemistry at C11 was lost upon opening of the epoxide group to give S20. Allylsilylation of the intermediate S20 reinstated the C11 stereocentre in intermediate S21.

Oxidation of 5 to the corresponding aldehyde S22 and carboxylic acid S23

The required oxidation of $\mathbf{5}$ to $\mathbf{S 2 3}$ proved more challenging than expected. Whilst it was possible to convert 5 to the aldehyde S22 using either the Dess-Martin periodinane ${ }^{8}$ (yields of $\mathbf{S 2 2} \mathbf{> 8 0 \%}$ were obtained on $<0.1 \mathrm{mmol}$ scale) or catalytic TPAP ${ }^{9}$ (yield of $\mathbf{S 2 2} \mathbf{9 1 \%}$ was obtained on a 0.5 mmol scale) on a small scale, these reagents were less appropriate for use on larger scales (see below for protocols). Larger scale oxidations of $\mathbf{5}$ to $\mathbf{S 2 2}$ were achieved using PCC (up to $>25 \mathrm{mmol}$ scale), although attempts to carry out this reaction catalytically ${ }^{10}$ proved unsuccessful. Subsequent conversion of S22 to the corresponding acid S23 was achieved using either Jones ${ }^{11}$ or Pinnick ${ }^{12}$ oxidation conditions (see below for protocols). Attempted one pot oxidation of alcohol $\mathbf{5}$ delivered the required acid $\mathbf{S} 2 \mathbf{3}$ in an isolated yield of $39 \%$ along with an unidentified second product making this protocol unusable.
( $\pm$ )-10b,11-diallyl-5-benzyl-10b,11-dihydro-5H-indolo[2,3-b]quinoline-11-carbaldehyde (S22)

To a stirred suspension of crude $5(28.30 \mathrm{mmol})$ and Celite ${ }^{\bullet}(6.71 \mathrm{~g})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(280 \mathrm{~mL})$ was added pyridinium chlorochromate ( $6.71 \mathrm{~g}, 31.13 \mathrm{mmol}, 1.1 \mathrm{eq}$.) and the reaction was left to stir at rt. After 16 hrs, the reaction was filtered through a pad of Celite ${ }^{\circ}$ and concentrated in vacuo to afford crude S22 as a yellow/brown amorphous solid. Aldehyde S22 was used without further purification.

Alternatively a TPAP Oxidation was used: alcohol 5 ( $200 \mathrm{mg}, 0.48 \mathrm{mmol}, 1$ eq.) was dissolved in DCM ( 5 mL ) before NMO ( $168 \mathrm{mg}, 1.43 \mathrm{mmol}, 3$ eq.) and TPAP ( $10 \mathrm{mg}, 0.028$ mmol, 0.06 eq.) were added and the mixture was left to stir for 8 hours. Further NMO (112 $\mathrm{mg}, 0.95 \mathrm{mmol}, 2 \mathrm{eq}$.$) was added and the reaction was left to stir overnight. The reaction$ mixture was quenched with a saturated solution of aq. $\mathrm{Na}_{2} \mathrm{SO}_{3}(5 \mathrm{~mL})$ before extracting with EtOAc ( 5 mL ) and washing the organic layer with water ( 5 mL ) and brine ( 5 mL ) The organic layer was dried with $\mathrm{MgSO}_{4}$ and concentrated in vacuo to afford $\mathbf{S 2 2}$ ( $181 \mathrm{mg}, 0.43 \mathrm{mmol}$, $91 \%)$ as a brown solid. No further purification was performed.

Alternatively a Dess-Martin oxidation was used: alcohol 5 ( $20 \mathrm{mg}, 0.048 \mathrm{mmol}, 1$ eq.) was dissolved in DCM ( 0.6 mL ) at room temperature before adding Dess-Martin periodinane ( 30 $\mathrm{mg}, 0.071 \mathrm{mmol}, 1.5 \mathrm{eq}$.). The reaction was left to stir for 1 hour before quenching with a saturated solution of aq. $\mathrm{NaHCO}_{3}(1 \mathrm{~mL})$. The mixture was diluted with DCM $(5 \mathrm{~mL})$ and washed with water ( 2.5 mL ), brine ( 2.5 mL ). The organic layer was dried with $\mathrm{MgSO}_{4}$ and concentrated in vacuo to afford a brown oil. Purification by column chromatography on silica gel ( $5 \%$ to $10 \%$ EtOAc/hexane) afforded $\mathbf{S 2 2}$ as a brown oil ( $16 \mathrm{mg}, 0.038 \mathrm{mmol}, 80 \%$ ).

To a stirred solution of crude $\mathbf{S 2 2}$ ( 28.3 mmol , 1 eq.) in acetone ( 280 mL ) at $0^{\circ} \mathrm{C}$ was added Jones reagent ( $31.7 \mathrm{~mL}, 42.5 \mathrm{mmol}, 1.34 \mathrm{M}, 1.5 \mathrm{eq}$. ) dropwise. After 1 h , the reaction was warmed to rt . After 16 h , the reaction was quenched with isopropyl alcohol ( 20 mL ) before concentrating ( $\sim 140 \mathrm{~mL}$ ) in vacuo. The reaction was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 150 \mathrm{~mL})$ and the combined organic extracts were washed with water ( $2 \times 100 \mathrm{~mL}$ ), brine ( 100 mL ), dried using $\mathrm{MgSO}_{4}$ and concentrated in vacuo to afford crude S23 as a yellow/brown solid. Carboxylic acid $\mathbf{S 2 3}$ was used without additional purification.

Alternatively, A 10 mL round bottomed flask was charged with $\mathbf{S 2 2}$ ( $151 \mathrm{mg}, 0.361 \mathrm{mmol}$ ) and 2-methyl-bute-2-ene ( $0.4 \mathrm{~mL}, 265 \mathrm{mg}, 3.78 \mathrm{mmol}$ ) before dissolving in tetrahydrofuran ( 2 mL ). A solution consisting of $\mathrm{NaH}_{2} \mathrm{PO}_{4}(248 \mathrm{mg}, 1.80 \mathrm{mmol}$ ) and sodium chlorite ( $80 \%$, $203 \mathrm{mg}, 18.0 \mathrm{mmol}$ ) in water ( 2 mL ) was prepared and added to the reaction flask and left to stir for 18 hours. The reaction mixture was extracted with ethyl acetate ( 5 mL ) before transferring to a separating funnel and washing the organic layer with water ( $2 \times 5 \mathrm{~mL}$ ) and brine ( $2 \times 5 \mathrm{~mL}$ ). The aqueous layer was extracted with ethyl acetate ( 5 mL ) and the combined organic fragments were dried $\left(\mathrm{MgSO}_{4}\right)$. The solvent was removed under reduced pressure to afford $\mathbf{S} 2 \mathbf{3}$ as a beige solid ( $141 \mathrm{mg}, 0.325 \mathrm{mmol}, 90 \%$ ).

Finally, a one-pot procedure was also achieved from direct Jones oxidation of alcohol $\mathbf{5}$ to S23. To a stirred solution of $\mathbf{5}(20 \mathrm{mg}, 47.6 \mu \mathrm{~mol})$ in acetone ( 0.5 mL ) at $0^{\circ} \mathrm{C}$ was added Jones reagent ( $0.12 \mathrm{~mL}, 160.8 \mu \mathrm{~mol}, 1.34 \mathrm{M}$ ) dropwise. ## Iodolactonisation protocol and evidence for structure of the major diastereomer 18

It was envisaged that four possible core structures could be formed when $\mathbf{S 2 3}$ was treated with an electrophilic source of iodine with variation resulting from the size of the lactone ring formed and which allyl group was involved in the reaction (Scheme S4). However only the five-membered ring in $\mathbf{1 8}$ (major isomer) and $\mathbf{S 2 4}$ (minor) were formed. The structure of 18 was assigned based on detailed NMR analysis of the mixture of diastereoisomers (Figures S2-S4).

Scheme S4 Four possible outcomes of an iodolactonisation reaction of S23. However, only $\mathbf{1 8}$ and its C2"epimer S24 were isolated as an inseparable 3:1 mixture. ${ }^{*}=$ inconsequential mixture of epimers.

The regioselectivity of the reaction was confirmed by HBMC analysis (Figure S2); a correlation between $\mathrm{H}-1^{\prime \prime}$ and $\mathrm{C} 3^{\prime \prime}$ was observed as well as a correlation between $\mathrm{H}-1^{\prime \prime}$ and C4'․ Furthermore, a correlation between $\mathrm{H}-1^{\prime}$ and $\mathrm{C} 3^{\prime}$ was observed as well as a correlation between $\mathrm{H}-\mathrm{1}^{\prime}$ and C5a which proved that the C10b allyl substituent was not involved in the iodolactonisation. Presumably, the formation of the intermediate iodonium ion was reversible, but because the 5-exo-tet cyclisation was kinetically favoured only 18/S24 were formed in the reaction.

Figure S2 The HMBC spectrum of iodolactones 18/S24. The key non-aromatic proton signals are highlighted.

Computational models of the epimers 18/S24 were calculated and their structures were minimised using the AM1 level of theory (Figure S3). The models were then examined to establish if any of the expected nOe enhancements would confirm the identity of the major epimer. It was proposed, if the relative stereochemistry was as drawn in 18, the distance between the protons $\mathrm{H}-1$ and $\mathrm{H}-2^{\prime \prime}$ would be ${ }^{\sim} 3.5 \AA$ and an enhancement should be observed. Conversely, if the stereocentre at C2" had the $S$ configuration (as drawn in S24), the distance between the protons at $\mathrm{H}-10$ and $\mathrm{H}-2^{\prime \prime}$ would be $\sim 3.6 \AA$ and an enhancement should be observed. The signal associated with the $\mathrm{H}-\mathbf{2}^{\prime \prime}$ proton ( $\mathbf{1 8}, \delta_{H} 4.34 \mathrm{ppm}$ ) was selectively irradiated and several enhancements were observed (Figure S4) An enhancement of the signals corresponding to the protons $\mathrm{H}-\mathbf{3}^{\prime \prime}\left(\mathbf{1 8}, \delta_{\mathrm{H}} 3.20,2.98 \mathrm{ppm}\right)$ and one of the protons of $\mathrm{H}-\mathbf{1}^{\prime \prime}\left(\mathbf{1 8}, \delta_{\mathrm{H}} 2.24 \mathrm{ppm}\right)$ was observed. This was expected as these protons are situated on the adjacent carbon atoms. An enhancement was observed in the multiplet at $\delta_{H} 7.12-7.01$ ppm which integrated to 4 protons and 2D-NMR analysis confirmed that the signal for the $\mathrm{H}-1$ proton resides within that multiplet (the protons $\mathrm{H}-2, \mathrm{H}-7$ and $\mathrm{H}-4$ are the other signals present in the multiplet). The multiplet at $\delta_{H} 7.37-7.24 \mathrm{ppm}$ integrated to 7
protons and the signal for the $\mathrm{H}-10$ proton was found within that multiplet. A nOe enhancement was not observed to the multiplet ( $\delta_{\mathrm{H}} 7.37-7.24 \mathrm{ppm}$ ) and therefore the stereochemistry of the major epimer 18.

## Oxidative cleavage of 18/S24

A two-step dihydroxylation, diol cleavage protocol using literature conditions ${ }^{13}$ for the dihydroxylation and subsequent lead tetracetate cleavage was achieved (see below for protocols). However, a one pot protocol involving dihydroxylation and then in situ cleavage of the diol with iodobenzene diacetate was preferred (Scheme S5). Use of 2,6-lutidine in the dihydroxylation step was carried out in line with literature precedent initially. ${ }^{14}$

## Reductive Amination of 19/S25

Initial studies focused on the use of benzylamine or p-methoxybenzylamine (Scheme S6). The diastereomeric mixture of aldehydes $19 /$ S25 was converted to the corresponding mixtures of secondary amines S27/S28 or S29/S30 in variable yields. Attempts to use aqueous ammonia ${ }^{16}$ or various ammonia surrogates ${ }^{17}$ proved unsuccessful.

Scheme S6 The reductive amination of 19/S25 with aliphatic amines benzylamine and p-methoxybenzylamine. Reaction conditions: benzylamine or $p$-methoxybenzylamine, MeOH ; then $\mathrm{NaBH}_{4}$ (1.1 eq.); ${ }^{*}=$ mixture of epimers 3:1.

Subsequent conversion of S27/S28 to the corresponding amino acid S31 (Scheme S7) by opening of the lactone ring enabled the synthesis of the $N$-protected lactam S32 although it proved very difficult to remove all of the $N, N$-diisopropyl urea (S33) side product from the sample of S32 (see experimental protocols below and Figure S5). The ${ }^{1} \mathrm{H}$ NMR spectrum of S31 showed as series of broad peaks.

Scheme S7 The synthesis of pentacyclic lactams S32 and S34 via amino acids S31 and S35 respectively. The structure of the urea by-product (S33) that was found to contaminate S32 is shown. * = mixture of epimers 3:1.

Figure S5 The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{S 3 1}$ (top spectrum) and the ${ }^{1} \mathrm{H}$ NMR spectrum of the crude reaction mixture on formation of S32.

The analogous conversion of aldehydes 19/S25 to S34 via S29/S30 and S35 was also achieved (Scheme S5) and in this case a pure sample of S34 was obtained (see below for analytical data). Finally, it was decided that the lactam $N$-protecting groups may prove very challenging to remove later in the synthesis and so another alternative was explored.

In an attempt to balance nucleophilicity with ease of protecting group removal it was decide to use a sulfinamide for the reductive amination. ${ }^{18,19}$ In this case $(R / S)$-tertbutanesulfinamide (12) was used. Reaction of the diastereomeric mixture $19 / \mathrm{S} 25$ with $(R / S)$ $\mathbf{1 2}$ gave $\mathbf{S 3 6}$ as a mixture of diastereomers (3:1 at C2", not separated) via the corresponding imines S37 (Scheme S8).

## Determining the Absolute Configuration at the C2' stereocentre in the major epimer 22

The direct iodoetherification of 6 proceeded in an analogous fashion to the iodolactonisation of $\mathbf{S} 23$ described above via a 5-exo-tet reaction to afford the products 22/S39 (11:1 ratio of epimers at C2'). Again, nOe analysis confirmed the confirguration at the C2" stereocentre in the major epimer of 22 (Figure S6).

Figure S6: Selective pulse irradiation at the $\mathrm{H}_{2}{ }^{\prime \prime}$ proton. Again, nOe enhancements inferred the configuration at the C2" stereocentre ( $R$ ) in the major epimer 22. The result was consistent with the nOe data obtained for iodolactone 18 in which the configuration at the C2" stereocentre in the major epimer was also found to be $(R)$. Further nOe enhancements were also observed at $\mathrm{H} 3^{\prime \prime}$ and $\mathrm{H} 1^{\prime \prime}$.

To a stirred solution of 22/ S39 ( $5.81 \mathrm{~g}, 10.6 \mathrm{mmol}, 1 \mathrm{eq}$.$) in THF ( 103 \mathrm{~mL}$ ) and water ( 12 mL ), was added NMO ( $1.87 \mathrm{~g}, 16.0 \mathrm{mmol}, 1.5 \mathrm{eq}$.). To this mixture, $\mathrm{OsO}_{4}(0.2 \mathrm{~mL}, 2.5 \% \mathrm{w} / \mathrm{w}$ solution in $n$-butanol, $0.19 \mathrm{~mol} \%$ ) was added and the reaction was left to stir for 16 hours. After this time, iodosobenzene diacetate ( $5.57 \mathrm{~g}, 16.0 \mathrm{mmol}$ ) was added and the reaction was left to stir for 3 hours. The reaction was quenched with a saturated solution of $\mathrm{Na}_{2} \mathrm{SO}_{3}$ (aq) $(10 \mathrm{~mL})$ and saturated $\mathrm{NaHCO}_{3 \text { (aq) }}(10 \mathrm{~mL})$. The reaction mixture was extracted with ethyl acetate $(120 \mathrm{~mL})$ and the organic layer was washing with water $(2 \times 50 \mathrm{~mL})$ and brine $(2 \times 50$ $\mathrm{mL})$. The aqueous liquids were further extracted with $\mathrm{EtOAc}(2 \times 50 \mathrm{~mL})$. The organic layer was dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure. The crude solid was purified by column chromatography on silica gel ( $20 \rightarrow 40 \%$ EtOAc: Hexane) to afford 23/S40 as an off white amorphous solid ( $3.83 \mathrm{~g}, 7.00 \mathrm{mmol}, 66 \%$ ).

## Comparison of synthetic ( $\pm$ )-2 to other reported spectra in the literature

## Comparison of Synthetic Dehaloperophoramidine TFA salt ( $\pm$ )-2.TFA with Material Provided by Prof. Chris Ireland

Synthetic ( $\pm$ )-2 was converted to the corresponding TFA salt ( $( \pm)$-2.TFA) by treatment with TFA in deuterated MeOH (Scheme S9). The ${ }^{1} \mathrm{H}$ NMR spectrum obtained was found to be in agreement with an authentic sample of 2.TFA provided by C. Ireland (Figure S7).

Scheme S9: Preparation of the TFA salt (2.TFA). This compound was prepared in order to compare it with an authentic sample of authentic 2.TFA, provided by Prof Chris Ireland.

Figure S7. The ${ }^{1} \mathrm{H}$ NMR spectra of synthetic ( $\pm$ )-2 (free-base in $\mathrm{CDCl}_{3}$, spectrum 3 ); synthetic ( $\pm$ )-2.TFA (TFA salt in $d_{4}$-MeOD, spectrum 2) and an authentic sample of 2.TFA (TFA salt in $d_{4}$-MeOD, spectrum 1). The region 6.35 -4.50 ppm contained a broad water signal in spectra 1 and 2 and has therefore been left out for clarity.

## Doping Experiment of Authentic 2.TFA with synthetic ( $\pm$ )-2.TFA for Structure Confirmation

D

Figure S8. ${ }^{1} \mathrm{H}$ NMR ( $d_{4}-\mathrm{MeOD}$ ) comparison of the aromatic region ( $7.60-6.80 \mathrm{ppm}$ ) of authentic 2.TFA (spectrum A) and synthetic 2.TFA (spectrum B). A sample of authentic 2.TFA was doped with synthetic 2.TFA and the resulting ${ }^{1} \mathrm{H}$ NMR has been superimposed on that of authentic 2.TFA (spectrum $\mathbf{C}$ ). A selected region in the aliphatic region (spectrum D; 1.97-1.55 ppm) showed that whilst the signals associated with $\mathrm{H}-\mathbf{1}^{\prime \prime}$ and $\mathrm{H} 1^{\prime}$ increased, a signal associated with a decomposition product from authentic 2.TFA remained unchanged.

A ${ }^{1} \mathrm{H}$ NMR spectrum ( $d_{4}-\mathrm{MeOD}$ ) of authentic 2.TFA was acquired (Figure $\mathrm{S9}$; red spectrum) before doping the sample with synthetic ( $\pm$ )-2.TFA and submitting for further ${ }^{1} \mathrm{H}$ NMR analysis (Figure S9; blue spectrum). The two spectra were overlaid (Figure S9).

Figure S9 The ${ }^{1} \mathrm{H}$ NMR spectrum ( $d_{4}-\mathrm{MeOD}$ ) from $\delta_{H} 2.80-1.50 \mathrm{ppm}$ of an authentic sample of 2.TFA (red spectrum) and the ${ }^{1} \mathrm{H}$ NMR spectrum of authentic 2.TFA doped with synthetic ( $\pm$ )-2.TFA (blue spectrum). An increase in the signals associated with protons $\mathrm{H}-1^{\prime}$ and $\mathrm{H}-1^{\prime \prime}$ were observed and the signal associated with a decomposition product in authentic 2.TFA ( $\delta_{\mathrm{H}} 2.22 \mathrm{ppm}$ and 1.63 ppm ) were unchanged.

The unknown impurity peaks from authentic 2.TFA were used as an internal reference. Whilst the peaks corresponding to 2.TFA increased, the impurity did not increase in intensity.

Table S2 Full comparison of the chemical shifts of our synthetic ( $\mathbf{\pm}$ )-2.TFA vs authentic 2.TFA reported by Ireland et al. Spectra run at 500 MHz in $\mathrm{CDCl}_{3}$ and referenced to 7.24 ppm . ${ }^{\text {ad }}$ During our attempts to prepare a sample of our synthetic $( \pm)$-2.TFA for comparison it was found that the chemical shifts of peaks in the 1H NMR analysis were very sensitive to the amount of TFA used. This led to significant challenges in preparing a sample that was analogous to previous reports. ${ }^{20,21}$
