Experimental details

Materials. All chemicals such as pinacol (C₆H₁₄O₂, 98%), 4-formylphenylboronic acid (C₇H₇BO₃, 97%), pyrrole (C₄H₅N, 99%), 1,4-benzenediboronic acid (C₆H₈B₂O₄, 96%), 4,4'-dibromobiphenyl (C₁₂H₈Br₂, 98%), boron trifluoride diethyl etherate (BF₃·C₄H₁₀O, 98%), propionic acid (C₃H₆O₂, 99.5%), cobalt acetate tetrahydrate (Co(OAc)₂·4H₂O, 99.5%), p-chloranil (C₆Cl₄O₂, 97%), tetrakis(triphenylphosphine)palladium(0) (C₇₂H₆₀P₄Pd, 99%), potassium carbonate (K₂CO₃, 99%), 5 wt% Nafion solution, and potassium hydroxide (KOH, 85%) were purchased from Sigma Aldrich or Alfa Aesar, which were used without further purification. All organic solvents (benzene, THF, CHCl₃, MeOH, Et₃N, nitrobenzene, DMF, AcOH, and 1,4-dioxane) were obtained from China Medicine Shanghai Chemical Reagent Co. and used as received unless otherwise stated. All the aqueous electrolyte solutions involved in this report were freshly prepared using Millipore water (~18.0 MΩ·cm resistivity at room temperature).

Synthesis

5,10,15,20-tetrakis(4′-bromophenyl)porphyrin (TBrPP), 5,10,15,20-tetrakis(4′-boronicacid-phenyl)porphyrin (TBPP) and cobalt (II) 5,10,15,20-tetrakis-(4′-bromophenyl)porphyrin (CoTBrPP) were synthesized following a reported procedure from reference.⁵¹-⁵³

Cobalt (II) 5,10,15,20-tetrakis(4′-boronicacid-phenyl)porphyrin (CoTBPP). To a suspension of TBPP (200 mg, 0.18 mmol) in 20 mL of DMF was added with
Co(OAc)$_2$·4H$_2$O (460 mg, 1.85 mmol). After refluxed at 160 °C for 3 h under Ar atmosphere, the precipitate was washed thoroughly by centrifugation with deionized water (20 mL×3) and MeOH (20 mL×6) until the supernatant was colorless. The residue was dried in vacuum oven to give CoTBPP as a red powder (190 mg, 90%). MALDI-TOF MS $m/z = 1175.1936$ (M$^+$), Calcd. for C$_{68}$H$_{72}$B$_4$CoN$_4$O$_8^+$: 1175.5054 (Figure S1a).

UV-vis (CH$_2$Cl$_2$) $\lambda_{max}$ (nm) 412, 527 (Figure S1b).

CoP-2ph-CMP. To a suspension of CoTBrPP (42 mg, 43 µmol) and CoTBPP (51 mg, 43 µmol) in 8 mL of 1, 4-dioxane under Ar atmosphere was added with an aqueous solution (2.0 mL) of K$_2$CO$_3$ (60 mg, 430 µmol) and tetrakis(triphenylphosphine)palladium(0) (2.5 mg, 2.2 µmol). The mixture was further purged with Ar for another 0.5 h and stirred at 100 °C for 72 h. Upon cooling, the solid was collected by filtration and the precipitate was washed thoroughly with water, methanol, THF, CHCl$_3$, and acetone, then rigorously extracted by Soxhlet for 24 h with THF, CHCl$_3$, methanol, and acetone, respectively. Finally, the obtained residual was dried at room temperature in vacuum oven to give CoP-2ph-CMP (42 mg, 73%) as a dark red solid.

CoP-3ph-CMP. To a suspension of CoTBrPP (180 mg, 182 µmol) and 1,4-benzenediboronic acid (61 mg, 367 µmol) in 20 mL of 1, 4-dioxane under Ar atmosphere was added with an aqueous solution (5.0 mL) of K$_2$CO$_3$ (252 mg, 1820 µmol) and tetrakis(triphenylphosphine)palladium(0) (10.5 mg, 9 µmol). The mixture was further purged with Ar for another 0.5 h and stirred at 100 °C for 72 h. Upon cooling, the solid was collected by filtration and the precipitate was washed thoroughly
with water, methanol, THF, CHCl₃, and acetone, then rigorously extracted by Soxhlet for 24 h with THF, CHCl₃, methanol, and acetone, respectively. Finally, the obtained residual was dried at room temperature in vacuum oven to give CoP-3ph-CMP (121 mg, 81%) as a dark red solid.

CoP-4ph-CMP. To a suspension of 4,4′-dibromobiphenyl (74 mg, 237 µmol) and CoTBPP (140 mg, 119 µmol) in 16 mL of 1, 4-dioxane under Ar atmosphere was added with an aqueous solution (4.0 mL) of K₂CO₃ (164 mg, 1190 µmol) and tetrakis(triphenylphosphine)palladium(0) (7 mg, 6 µmol). The mixture was further purged with Ar for another 0.5 h and stirred at 100 °C for 72 h. Upon cooling, the solid was collected by filtration and the precipitate was washed thoroughly with water, methanol, THF, CHCl₃, and acetone, then rigorously extracted by Soxhlet for 24 h with THF, CHCl₃, methanol, and acetone, respectively. Finally, the obtained residual was dried at room temperature in vacuum oven to give CoP-4ph-CMP (95 mg, 82%) as a dark red solid.

Pyrolysis procedure for Co-2ph-CMP. The pyrolysis procedure of CoP-2ph-CMP was carried out under N₂ atmosphere in tube furnace. The samples were first heated from the room temperature to 800 °C at a heating rate of 3 °C/min, and then pyrolyzed at this temperature for 2 h. Finally, it is allowed to cool down to give CoP-2ph-800-CMP as a black powder. The N₂ flow was kept at 100 scm during the whole process. In addition, CoP-3ph-800-CMP and CoP-4ph-800-CMP were also prepared following similar pyrolysis procedure.
Characterizations. High-resolution MALDI-TOF mass spectrometry (HRMS) data were collected on a Bruker Daltonics Inc. LTQ Orbitrap XL hybrid Fourier Transform High-resolution Mass Spectrometer. UV-vis spectra were obtained for samples in standard glass cuvettes with a UNIC-3802 spectrophotometer. Scanning electron microscopy (SEM) pictures and transmission electron microscopy (TEM) images were taken using a SIRION200 Schottky field emission scanning electron microscope and a JEM-2011 electron microscope, respectively. Fourier transformed-Infrared spectroscopy (FT-IR) spectra were performed on a Thermo Fisher Scientific instrument (Nicolet iS10). Powder X-ray diffraction (PXRD) patterns were collected on D/max-TTR III X-ray diffractometer with a scan rate of 5°/min. The nitrogen sorption measurements were carried out on Quantachrome instrument (ASIQM0000-5). The surface area and the pore size distribution was analyzed using Brunauer-Emmett-Teller (BET) method and Quenched Solid Density Functional Theory (QSDFT), respectively. X-ray photoelectron spectroscopy (XPS) data were obtained via a Thermo ESCALAB 250 X-ray photoelectron spectroscopy system equipped with a 150-watt Al K Alpha excitation source.

Electrochemistry. All the electrochemical measurements were performed on an electrochemical work station (CHI760E, purchased from Shanghai Chen Hua Instrument Co., Ltd.) in a standard three-electrode system in 1 M KOH solution. The modified glassy carbon electrode (GCE, 3 mm, 0.071 cm²) was used as the working electrode, while an Ag/AgCl electrode (3 M KCl, corrected before each test) served as the reference electrode and a platinum wire served as the counter electrode. All the
potentials in this report were versus the reversible hydrogen electrode (RHE) unless otherwise noted, according to the equation:

\[ E = E_{\text{appl}} + E_{\text{Ag/AgCl}} + 0.059pH \]

Where \( E_{\text{appl}} \) represents the applied potential versus Ag/AgCl, and \( E_{\text{Ag/AgCl}} \) is the potential of the reference electrode (Ag/AgCl electrode). The catalyst ink was prepared according to the following proportions: 2 mg of catalyst powders, 900 μL of ethanol and 100 μL of 5 wt% Nafion solution. Then the suspension was vigorously sonicated for 30 min. For fabricating the working electrode, 5 μL of the as-prepared homogeneous ink was carefully dropcast onto the polished mirror-like GCE (catalyst loading: ∼0.14 mg/cm\(^2\)) and it was allowed to dry in air at room temperature.
