Supplementary information

All starting materials were purchased from Aldrich or Fisher Scientific and required no purification. NMR spectra were acquired using a Bruker Avance 400 spectrometer. Electrospray ionisation mass spectrometry was performed on 1 mg mL$^{-1}$ methanol or acetonitrile solutions using a Walter Ltd. TQD mass spectrometer. FT-IR spectra attained for solid samples were recorded over 16 scans on a Perkin Elmer Spectrum 100 series spectrometer from 4000 cm$^{-1}$ to 550 cm$^{-1}$ at a resolution of 1 or 0.5 cm$^{-1}$. Elemental analysis was performed using an Exeter CE-440 Elemental Analyser. All samples submitted were dried for four hours under vacuum in an Abderhalden drying pistol.

Synthesis of 1-Butyl-3-pyridin-3-ylmethyl-urea (L1)

3-Picolylamine (1.00 mL, 9.82 mmol) and $n$-butyl isocyanate (1.11 mL, 9.82 mmol) were added to chloroform (50 mL). The solution was put under nitrogen and refluxed at 70 °C for 4 hours. The solvent was evaporated off in vacuo, and the resulting white solid was washed with water and dried in vacuo at ~ 50 °C for 4 hours (0.70 g, 34%).

**Synthesis of ligands L2 - L5.**

Ligands L2 – L5 where synthesised via reaction of 3-picolyamine with an equimolar amount of the relevant isocyanate. 3-Picolylamine and the corresponding isocyanate were added to toluene (5 mL). The solution was sonicated for 2 minutes. The resulting solid was collected by filtration, was washed with water then dried in vacuo at ~ 50 °C for 4 hours.

**1-Octyl-3-pyridin-3-ylmethyl-urea (L2)**

![Structural formula of 1-Octyl-3-pyridin-3-ylmethyl-urea (L2)](image)

Prepared using 3-picolyamine (0.50 mL, 4.91 mmol) and n-butyl isocyanate (0.87 mL, 4.91 mmol). The product is obtained is a white solid (1.19 g, 92%).

**Gelation Tests**

Gelation tests on the ligands were carried out at 2.5 % by weight of gelator to volume of solvent used. 10 mg of gelator was added to 0.40 mL of solvent in a S1.75 vial (2 mL, 12 mm diameter) then sonicated for 30 seconds. The sample was then heated until a homogeneous solution was observed then left to cool for 1 hour. After cooling the contents of the vial was assigned as a gel, partial gel, crystal, precipitate or solution.

**Formation of Metallogels**

Gelation of metallogels was also carried out at 2.5 % by weight of gelator to volume of solvent. 10 mg of gelator was added to 0.39 mL of solvent and 0.01 mL of a metal solution composed of either 1 or 2 equivalents of metal salt dissolved in methanol. Gelation was tested in the solvents toluene, 1,3-dichlorobenzene and nitrobenzene. The same procedure
as for ligand gelation tests previously mentioned was used for heating, cooling and characterisation.

**Rheology**

Oscillatory stress-sweep experiments were performed using a TA Instruments AR Rheometer 2000 or TA Instruments Discovery Hybrid rheometer HR 2 with a parallel plate set up using a 25 mm rough plate geometry. Experiments were carried out at 10 °C and a fixed frequency of 1 Hz. When preparing the sample, 2 mL of hot gelator solution was transferred to a glass cylinder sealed with vacuum grease to prevent spillage from the sol. The sol was left for 30 minutes to allow the gel to form after which the glass cylinder was removed and the gap reduced to 2500 μm before date collection.

**Scanning Electron Microscopy**

Samples of 1% (w/v) gels were applied to silicon plates and left to dry in air at room temperature for 24 h. The resulting xerogels were coated with 2 nm platinum using a Cressington 328 Ultra High Resolution EM Coating System. The images were obtained using an FEI Helios NanoLab DualBeam microscope in immersion mode, with beam settings of 1.5 kV and 0.17 nA. For images of less than 2500 magnification (labelled ETD) immersion mode was not used.

**Fourier Transform Infrared Spectroscopy of Xerogels**

Xerogels where obtained by transferring a small amount of a preformed gel to a watch glass and leaving it for a week to air-dry.

**Single Crystal X-ray Diffraction**

Crystals of L5 were obtained by heating 10 mg of the ligand in 0.40 mL of methanol until homogeneous. The solution was left for a week to allow the solvent to evaporate resulting in clear needle like crystals. Crystals of the complex [Zn(L4)2Cl2] were obtained by heating 10 mg of L4 with 2 equivalents of ZnCl2 (dissolved in 0.01 mL methanol) in 0.40 mL of water for
approximately 1 minute. The solution was left for 3 weeks over which time clear square shaped crystals formed.
