**General methods:**

**Materials.** Ethylisocyanacetate (Sigma-Aldrich), ethylisocyanopropionate (Sigma-Aldrich), trifluoromethanesulfonic acid (TfOH, Kanto chemicals), N-(4-methoxybenzylidene)aniline (9, TCI), and 6,7-dimethoxy-3,4-dihydroisoquinoline (11, Ark Pharm, Inc.) were used as obtained. Molecular sieves 3Å (MS 3A) as a dehydrator was activated by careful heating by a heat gun under vacuum. The other chemicals and solvents were used without purification.

**Measurements.** $^1$H NMR (400 MHz) and $^{13}$C NMR (100 MHz) spectra were recorded on JEOL JNM-ESC400 and Bruker AVANCE II 400 spectrometers using CDCl$_3$, CD$_2$OD, and DMSO-$d_6$ as the solvent, calibrated using residual undeuterated solvent and tetramethylsilane as the internal standard. DOSY spectra were recorded on a Bruker AVANCE II 400 spectrometer. All experiments were run without spinning to avoid convection. The standard Bruker pulse program, ledbp2g2s, employing simulated echo and longitudinal eddy delay with bipolar gradients and two spoil gradients, was utilized. The obtained DOSY spectra were processed by Topspin 3.2 software. Diffusion dimension was generated using the inversion of Laplace transform driven by the CONTIN method. Diffusion coefficients of a chosen narrow chemical shift in the spectra of the polymers were extracted from T1/T2 analysis module of Topspin 3.2. FT-IR spectra were measured using a Thermo Fischer Scientific Nexus 870 spectrometer. MALDI–TOF MS spectra for small molecules were recorded on a Shimadzu AXIMA-CFR plus mass spectrometer (matrix: CHCA). Hydrodynamic diameters of the polymers were estimated by dynamic light scattering (DLS) measurements (Malvern, Zetasizer nanoZSP) using 1.0 mg/mL polymer solutions in THF at 25 °C.

**Poly-10:** Since the typical procedure gave a complex mixture by the degradation of 10, the modified procedure involving the preparation of 10 *in situ* was performed to give Poly-10. To a suspension of benzylamine (109 µL, 1.00 mmol) and 1 (123 mg, 1.00 mmol) in *i*-PrOH (0.5 mL) was added TfOH (88.5 µL, 1.00 mmol) and isobutyaldehyde (91.3 µL, 1.00 mmol) at 0 °C. The mixture was warmed to room temperature, stirred for 2 d, and concentrated in vacuo. The resulting crude was further stirred for 1 d at room temperature and diluted with CHCl₃. The reaction was quenched by the addition of water. The products were extracted with CHCl₃. The combined organic layer was dried over MgSO₄, filtered, and concentrated in vacuo. The crude was diluted with a small amount of CHCl₃ and the solution was reprecipitated in hexane to give hexane-insoluble part (Poly-10, 201 mg, 82%) as a white solid and hexane-soluble part (45.9 mg, 18%) as a yellow oil: Mₙ 8,600 Da (estimated by DOSY); ¹H NMR (400 MHz, CDCl₃, 298 K) δ 7.5–6.8 (m, Ar), 6.4–6.3 (m, NH), 4.6–3.4 (m, CH, CH₂), 2.7–2.2 (m, CH), 1.2–0.7 (m, CH₃) ppm; D: 6.46–8.27 × 10⁻¹⁰ m²/S; ¹³C NMR (100 MHz, CDCl₃, 298 K) δ 170.2 (C=O, amide), 168.7 (C=O, amide), 165.3 (C=O, amide), 141.0, 138.2, 137.9, 135.1, 130.3, 130.0, 129.5, 129.3, 129.1, 128.9, 128.8, 128.5, 128.0, 127.7, 127.4, 127.3, 127.2, 126.9, 66.5 (CH), 65.9 (CH), 51.9 (CH₂), 51.8 (CH₂), 43.7 (CH₂), 43.4 (CH₂), 43.2 (CH₂), 30.2 (CH), 30.0 (CH), 27.3 (CH), 21.9 (CH₃), 21.8 (CH₃), 21.5 (CH₃), 21.1 (CH₃), 20.0 (CH₃), 19.4 (CH₃), 18.7 (CH₃), 18.3 (CH₃), 18.1 (CH₃) ppm; IR (NaCl) ν 2965, 1655, 1535, 1455, 1247, 1165, 1030, 753 cm⁻¹.
