General Considerations \hfill S2

Direct Synthesis of [3]AuLi\textsubscript{2}Cl \hfill S13

References \hfill S18
**General Considerations:** All manipulations were carried out using standard Schlenk or glovebox techniques under a dinitrogen atmosphere unless otherwise stated. Dry solvents were obtained via distillation under argon from calcium hydride (acetonitrile), sodium-potassium alloy (diethyl ether), and potassium benzophenone ketyl (tetrahydrofuran). Benzene, methylene chloride and fluorobenzene were collected from a solvent purification system by SG Waters USA, LLC utilizing a fifteen minute argon sparge followed by passage through activated aluminum. Compounds [2]Li and [3]Li₂ were prepared according to the literature.¹,² Unless specifically stated, reagents were purchased from commercial vendors and used without further purification. Nuclear magnetic resonance (NMR) spectroscopy was carried out using: Bruker Avance 300 MHz, Bruker Avance 600 MHz, and Varian Inova 300 MHz. NMR chemical shifts are reported in parts per million (ppm) with ¹H and ¹³C chemical shifts referenced to the residual non-deuter solvent. The ¹¹B-¹H coupling constants from ¹¹B spectra are reported when possible. Infrared spectroscopy was recorded on a Bruker ALPHA FTIR Spectrometer. High-resolution mass spectrometry (HRMS) was collected on an Agilent Technologies 6210 (TOF LC/MS) featuring electrospray ionization. Complete crystallographic data for compounds [2]Au and [3]AuLi are available free of charge from the Cambridge Crystallographic Data Center under reference numbers 1449175 and 1449174, respectively. These structures can be accessed at: [http://www.ccdc.cam.ac.uk/](http://www.ccdc.cam.ac.uk/).

**Synthesis of [2]Au:**

A 20 mL scintillation vial was equipped with a stir bar and loaded with [2]Li (50.0 mg, 126 µmol) and ClAuMe₂ (37.9 mg, 126 µmol). The vial was cooled to -40 °C in a cold well before cold (-40 °C) F-C₅H₅ (5 mL) was added and the reaction stirred for 30 minutes at -40 °C. After thirty minutes the reaction mixture was pumped down to dryness then methylene chloride (7 mL) was added, the mixture was stirred then filtered and the filtrate set aside. Methylene chloride (7mL) was added and the mixture was stirred then filtered. The combined filtrate was pumped down to dryness furnishing [2]Au (69.4 mg, 82% yield). Single crystals for the X-ray diffraction study were obtained by preparative crystallization from THF and hexane at -30 °C overnight. ¹H NMR (300 MHz, methylene chloride-d₂, 25 °C): δ = 7.71 (d, ³J(H,H) = 2.1 Hz, 1H), 6.99 (m, 2H), 6.83 (d, ³J(H,H) = 2.1 Hz, 1H), 2.60 (s, 6H), 2.33 (s, 3H), 1.96 (s, 6H), 3.8 – 0.75 (bm, 11H) ppm. ¹H[¹¹B] NMR (192.5 MHz, methylene chloride-d₂, 25 °C): δ = 7.71 (d, 1H), 6.99 (m, 2H), 6.83 (d, 1H), 2.63 (s, 5H, B-H), 2.60 (s, 6H), 2.33 (s, 3H), 1.97 (s, 6H), 1.75 (s, 1H), 1.68 (s, 5H) ppm. ¹³C[¹¹H] (75 MHz, methylene chloride-d₂, 25 °C): δ = 175.2, 140.4, 135.9, 135.1, 129.6, 124.3, 121.6, 78.8, 24.4, 21.3, 17.9 ppm. ¹¹B[¹¹H] NMR (96 MHz, methylene chloride-d₂, 25 °C): δ = -8.7, -13.6 ppm. ¹¹B NMR (96 MHz, methylene chloride-d₂, 25 °C): δ = -8.7 (¹¹J(H,B) = 134.4 Hz), -13.6 (¹¹J(H,B) = 144 Hz) ppm. IR (evaporated methylene chloride film, ATR, 25 °C): 2533 (B-H). HRMS (negative mode ESI/APCI) [M-H]⁻: m/z Calc: C₁₅H₂₉B₂₂N₂Au₁S₁ = 585.2828 : Found = 585.2847.

A 20 mL glass scintillation vial was equipped with a stir bar and loaded with [3]Li₂ (50.1 mg, 76 μmol) and ClAuSMe₂ (22.6 mg, 76 μmol). The vial was cooled to -40 °C in a cold well and cold (-40 °C) fluorobenzene (5 mL) was added. After 15 minutes any brown solid on the walls of the scintillation vial was scraped down into the reaction mixture and further stirred for 30 minutes at -40 °C. Note: [3]Li₂ is not very soluble in F-C₆H₅ and builds up on the vial walls. More F-C₆H₅ (5 mL) was added to the reaction mixture and the reaction was filtered while cold. The solvent was removed in vacuo giving [3]AuLi as a gold film (15.2 mg, 22% yield). A crystal of [3]AuLi was grown by cooling a solution of F-C₆H₅ and hexane at -30 °C. ¹H NMR (300 MHz, methylene chloride-d₂, 25 °C): δ = 7.34 (s, 2H), 2.78 (s, 6H) 3.38-0.60 (bm, 22H) ppm. ¹H[¹¹B] NMR (192.5 MHz, methylene chloride-d₂, 25 °C): δ = 7.34 (s, 2H), 2.78 (s, 6H), 2.58 (s, 5H), 1.68 (s, 1H), 1.60 (s, 5H) ppm. ¹³C[¹H] (150 MHz, methylene chloride-d₂, 25 °C): δ = 174.3, 122.3, 79.9, 25.1 ppm. ¹¹B[¹H] NMR (96 MHz, methylene chloride-d₂, 25 °C): δ = -8.8, -13.8 ppm. ¹¹B NMR (96 MHz, methylene chloride-d₂, 25 °C): δ = -8.8 (¹J(H,B) = 134.4 Hz), -13.8 (¹J(H,B) = 124.8 Hz) ppm. IR (evaporated methylene chloride film, ATR, 25 °C): 2532 (B-H). HRMS (negative mode ESI/APCI) [M]⁺ m/z Calc: C₇H₃₀B₂₂N₂Au₂S₁ = 609.3999 : Found = 609.3996, [M-S(Me)]⁺ m/z Calc: C₃H₂₀B₂₂N₂Au₁ = 547.3807: Found = 547.3807.

**Direct Synthesis of [3]AuLi$_2$Cl:**

A 20 mL scintillation vial was equipped with a stir bar and loaded with [3]Li$_2$ (50.6 mg, 77.3 μmol) and ClAuSMe$_2$ (22.8 mg, 77.3 μmol). The solids were dissolved in THF (2 mL) and the solution was stirred for 2 hours at room temperature, then the high vacuum was applied for three minutes (*removes liquid dimethylsulfide*). After applying vacuum THF (1 mL) was added to the solution and the reaction was stirred for another two hours at room temperature then finally pumped down furnishing the title compound [3]AuLi$_2$Cl quantitatively. The spectroscopic data matches that provided above.

A 20 mL scintillation vial was equip with a stir bar and [3]AuLi (34.3 mg) was dissolved in a minimal amount of THF. The THF was then saturated in LiCl and stirred at room temperature for two hours. After two hours the reaction was pumped on via high vacuum (1 minute) then THF (1 mL) was added and stirred for another two hours then pumped down to dryness. Acetonitrile (2 mL) was added and the reaction mixture filtered. The acetonitrile was pumped down giving to quantitatively afford [3]AuLi₂Cl. The spectroscopic data matches that provided above.

X-Ray Structure Determination

Crystal Structure of [2]Au:

A brown fragment of a prism (0.325 x 0.288 x 0.168 mm³) was used for the single crystal x-ray diffraction study of C₁₅H₃₀N₂B₁₁SAu₀.₈₈Cs₀.₁₂C₄H₈O (sample vL156SF_0m). The crystal was coated with paratone oil and mounted on to a cryo-loop glass fiber. X-ray intensity data were collected at 100(2) K on a Bruker APEX2 platform-CCD x-ray diffractometer system (fine focus Mo-radiation, λ = 0.71073 Å, 50KV/30mA power). The CCD detector was placed at a distance of 5.0600 cm from the crystal.
A total of 3600 frames were collected for a sphere of reflections (with scan width of 0.3° in ω, starting ω and 20 angles at –30°, and φ angles of 0°, 90°, 120°, 180°, 240°, and 270° for every 600 frames, 10 sec/frame exposure time). The frames were integrated using the Bruker SAINT software package and using a narrow-frame integration algorithm. Based on an orthorhombic crystal system, the integrated frames yielded a total of 96913 reflections at a maximum 2θ angle of 52.728° (0.80 Å resolution), of which 5742 were independent reflections (R_{int} = 0.0304, R_{sig} = 0.0108, redundancy = 16.9, completeness = 100%) and 4992 (86.9%) reflections were greater than 2σ (I). The unit cell parameters were, a = 18.8223(7) Å, b = 15.7649(6) Å, c = 18.9175(7) Å, α = β = γ = 90°, V = 5613.4(4) Å³, Z = 8, calculated density D_c = 1.540 g/cm³. Absorption corrections were applied (absorption coefficient μ = 4.867 mm⁻¹; max/min transmission = 0.495/0.301) to the raw intensity data using the SADABS program.

The Bruker SHELXTL software package was used for phase determination and structure refinement. The distribution of intensities (E²-1 = 1.104) and systematic absent reflections indicated one possible space group, Pbca. The space group Pbca (#61) was later determined to be correct. Direct methods of phase determination followed by two Fourier cycles of refinement led to an electron density map from which most of the non-hydrogen atoms were identified in the asymmetric unit of the unit cell. With subsequent isotropic refinement, all of the non-hydrogen atoms were identified. There was one disordered molecule of C_{15}H_{30}N_{2}B_{11}SAu and one disordered THF solvent present in the asymmetric unit of the unit cell. The Au/Cs and THF disordered site occupancy ratios were 88%/12% and 55%/45%, respectively.

Atomic coordinates, isotropic and anisotropic displacement parameters of all the non-hydrogen atoms were refined by means of a full matrix least-squares procedure on F². The H-atoms were included in the refinement in calculated positions riding on the atoms to which they were attached. The refinement converged at R1 = 0.0165, wR2 = 0.0395, with intensity, I>2σ (I). The largest peak/hole in the final difference map was 0.524/-0.425 e/Å³

Crystal Structure of [3]AuLi:

A colorless plate fragment (0.308 x 0.266 x 0.056 mm³) was used for the single crystal x-ray diffraction study of [Li[C₄H₈O]₂][C₇H₃₅B₂₂N₂SAu] (sample vL163SF_0m). The crystal was coated with paratone oil and mounted on to a cryo-loop glass fiber. X-ray intensity data were collected at 200(2) K on a Bruker APEX2 platform-CCD x-ray diffractometer system (fine focus...
Mo-radiation, $\lambda = 0.71073$ Å, 50KV/30mA power). The CCD detector was placed at a distance of 5.0600 cm from the crystal.

A total of 3600 frames were collected for a sphere of reflections (with scan width of 0.3° in $\omega$ and $\phi$, starting $\omega$ and $2\theta$ angles of –30°, and $\phi$ angles of 0°, 90°, 120°, 180°, 240°, and 270° for every 600 frames, 30 sec/frame exposure time). The frames were integrated using the Bruker SAINT software package and using a narrow-frame integration algorithm. Based on a monoclinic crystal system, the integrated frames yielded a total of 98237 reflections at a maximum $2\theta$ angle of 59.142° (0.72 Å resolution), of which 12091 were independent reflections ($R_{int} = 0.0477$, $R_{sig} = 0.0287$, redundancy = 8.1, completeness = 100%) and 10308 (85.3%) reflections were greater than 2$r(I)$. The unit cell parameters were, $a = 11.1021(7)$ Å, $b = 14.8321(10)$ Å, $c = 26.1690(17)$ Å, $\beta = 90.0492(12)^{\circ}$, $V = 4309.2(5)$ Å$^3$, $Z = 4$, calculated density $D_c = 1.394$ g/cm$^3$. Absorption corrections were applied (absorption coefficient $\mu = 3.495$ mm$^{-1}$; max/min transmission = 0.828/0.412) to the raw intensity data using the SADABS program.

The Bruker SHELXTL software package was used for phase determination and structure refinement. The distribution of intensities ($E^2-1 = 0.812$) and systematic absent reflections indicated one possible space group, P2(1)/n. The space group P2(1)/n (#14) was later determined to be correct. Direct methods of phase determination followed by two Fourier cycles of refinement led to an electron density map from which most of the non-hydrogen atoms were identified in the asymmetric unit of the unit cell. With subsequent isotropic refinement, all of the non-hydrogen atoms were identified. There was one disordered cation of [Li[C$_4$H$_8$O$_2$]$^+$ and one disordered anion of [C$_7$H$_{30}$B$_{22}$N$_2$SAu]$^-$ present in the asymmetric unit of the unit cell. Three of the four THF molecules of the cation were modeled with disorder (disordered site occupancy ratios were 80%/20%, 77%/23%, and 55%/45%). The AuSC$_2$H$_6$-group of the anion was modeled with disorder (disordered site occupancy ratios were 81%/19%). The structure was refined as a pseudo-merohedral twin (twin law 1 0 0 -1 0 0 0 -1, and twin ratio of 59%/41%).

Atomic coordinates, isotropic and anisotropic displacement parameters of all the non-hydrogen atoms were refined by means of a full matrix least-squares procedure on $F^2$. The H-atoms were included in the refinement in calculated positions riding on the atoms to which they were attached. The refinement converged at $R_1 = 0.0314$, $wR_2 = 0.0704$, with intensity $I>2\sigma(I)$. The largest peak/hole in the final difference map was 1.080/-0.861 e/Å$^3$.
