Fig. S3 Infrared spectra of ZIF-8, ZM-10 and ZM-20.
Fig. S4 High resolution (a) Mo (3d), (b) S (2p) and (c) Zn (2p) X-ray photoelectron spectrum of 1T-MoS$_2$. (Mo (3d) peaks are deconvoluted to show 1T and 2H components).
On exfoliating bulk MoS$_2$ which is in 2H-form by nature partially converts to metallic 1T-polytype, quantification of different polytypes through XPS is difficult since some of transformed 1T-MoS$_2$ reverts back to 2H-phase while drying process; unavoidable during preparation of sample. Even though we obtained 1T/2H ratio of ~ 48 % in case of exfoliated MoS$_2$ as revealed by the convoluted Mo (3d) core level signals (Fig. S4) while MoS$_2$-ZIF-8 exhibits peaks only due to 2H-phase (Fig. S5). Since core level Mo (3d) signals of 1T-MoS$_2$ are broader, and it is a combination of different components (1T and 2H-phase) difficult to correlate these core level signals.

**Fig. S8** (a) TEM and (b) AFM image of exfoliated MoS$_2$. 
Fig. S9 (a) TEM image of exfoliated MoS$_2$, (b) FESEM images of ZM-5 and (c, d) TEM images of ZM-10 and ZM-20.
**Fig. S10** (a) HRTEM image of MoS$_2$-ZnS; (b) High resolution Mo (3d) X-ray photoelectron spectra of MoS$_2$ and MoS$_2$-ZnS obtained from ZM-20; (c, d) High resolution Mo (3d) and Zn (2p) X-ray photoelectron spectrum of MoS$_2$-ZnS.
**Fig. S11 (a, b)** TEM and FESEM images of 2H-MoS$_2$ and (c, d) TEM images of MoS$_2$-ZIF-8 (Arrows indicates ZIF-8 coating over nanosheets) obtained from 2H-MoS$_2$. 
To confirm the coordination modulation effect of negatively charged sulfur, we have prepared MoS$_2$-ZIF-8 composite starting from 2H-MoS$_2$ instead of 1T-polytype with the similar procedure. Unlike the situation of 1T-MoS$_2$, semiconducting 2H-MoS$_2$ does not have negative charges on sulfur atoms of basal-plane. 2H-MoS$_2$ nanosheets required for these experiments are obtained from hydrothermal method.$^1$ On in-situ composite formation (similar procedure like 1T-MoS$_2$) we observed coating of ZIF-8 at the 2H-MoS$_2$ nanosheet edges as revealed by TEM images (Figures S11a, b), in contrast to ZM nanocomposites. The ZIF-8 coating is attributed to the dangling bonds of 2H-MoS$_2$ at the edges which are the only nucleation sites for available for ZIF-8 precursor’s results in the growth at the edge sites in the absence of basal-plane negative charges.
