Supporting Information for “Circularly Polarized Luminescence on dinuclear Tb(III) and Eu(III) complexes with (S-) and (R-) 2-Phenylpropionate”

Berta Casanovas, Francesco Zinna, Lorenzo Di Bari, Mohamed Salah El Fallah, Mercè Font-Bardia and Ramon Vicente*

CPL spectra
The samples were excited with a UV-B fluorescent lamp ($\lambda_{\text{max}} = 365$ nm) with a 90° degree geometry. The spectra were recorded on a quartz plate deposition prepared from a CH$_3$CN suspension. At least two different depositions for each enantiomer were measured to check the reproducibility of the measurements. In order to rule out the occurrence of contributions from linear luminescence anisotropy, the sample was rotated by 90°, 180°, 270° and then flipped around its C2 axis in order to measure both the faces of the deposition. A spectrum was recorded after each rotation to check that no significant difference depending on the rotation angle was present. Solution spectra were measured on a 10$^{-3}$ M CH$_2$Cl$_2$ solution.

ECD spectra
ECD spectra were recorded with a Jasco J-710 spectropolarimeter on the same samples used for CPL measurements. In order to rule out the occurrence of contributions from linear dichroism/linear birefringence, the sample was rotated as described above for CPL spectra.

Luminescence spectra
The comparison between he excitation/emission spectra in powder solid and in CH$_3$CN suspension was performed with a iHR 320 Horiba Jobin Yvon spectrometer.

NMR spectra
NMR were performed with a Varian spectrometer operating at 600 MHz for $^1$H. Temperature was set to 25.0 ± 0.1 °C. The spectra were measured in CDCl$_3$.
