**Fig. 1 Supplementary.** Agarose gels for PCR experiments for BCL2 and β-ACTIN gene expression. Cells were untreated (CTRL), treated with 2.5 µg/ml Vitexin-2-O-xyloside (XVX), 50 µg/ml Betacyanins (BC), or 2.5 µg/ml Vitexin-2-O-xyloside+50 µg/ml Betacyanins (XVX+BC) for 24h, before RNA extraction and cDNA production. The values of the quantification of the intensity of the bands corresponding to BCL2 gene expression, after normalization with β-ACTIN levels in each sample, are shown. Three replicate experiments were performed. n.s.: not statistically significant.
