General comments

All chemicals were purchased from commercial sources (Sigma Aldrich or Kemika) and were used without further purification. Acetonitrile was dried and distilled before use. Retsch MM400 mixer mill was used for ball milling experiments.

Solution $^1$H and $^{13}$C NMR spectra were acquired on Brucker Avance (300 and 600 MHz) spectrometers with tetramethylsilane as an internal standard. FTIR-ATR spectra were recorded using a Fourier Transform-Infrared Attenuated Total Reflection PerkinElmer UATR Two spectrometer in the range 400 cm$^{-1}$ to 4000 cm$^{-1}$. HRMS analysis was performed on MALDI TOF/TOF 4800 Plus analyzer. Elemental CHN analyses were carried out on Perkin Elmer 2400 Series II CHNS analyzer. Analysis of PXRD patterns was conducted using Analytical X'Pert Highscore Plus software. Experimental pattern for 3p was compared to simulated pattern calculated from the published crystal structure using Mercury crystal structure viewing software. Crystallographic Information Files containing published crystal structures were obtained from the Cambridge Structural Database (CSD).

High-resolution powder X-ray diffraction data for compounds 3q and 3v were collected at the Diamond Light Source, beamline I12-JEEP ($\lambda=0.23307\text{Å}$). Crystal structures of 3q and 3v were solved by simulated annealing from powder diffraction data and refined using the Rietveld method$^1$ with geometrical restraints set to expected values for bond distances and angles as well as planarity restraints, but with refined torsion angles and selected distances. All calculations including indexing, structure solution, and Rietveld refinement have been carried out using the program Topas 4.1.$^2$
Synthesis of thiocarbamoyl benzotriazoles

Compounds 2a, 2b, 2d, 2e, and 2j are known and were synthesised following the reported procedure.3

General procedure for the synthesis of thiocarbamoyl benzotriazoles

An equimolar mixture of an amine and bis(benzotriazolyl)methanethione (1) was ground in the presence of dry acetonitrile (LAG experiment, \( \eta = 0.25 \ \mu L \ \text{mg}^{-1} \)) using 10 mm stainless steel ball at 30 Hz for 10 minutes. The crude mixture was left in a ventilated hood to allow acetonitrile to evaporate, then scraped off the walls of the grinding jar, suspended in distilled H\(_2\)O (10 mL) and stirred at r.t. for 30 minutes. The precipitate was collected by filtration, washed with distilled H\(_2\)O and the resulting solid was air-dried to give aryl N-thiocarbamoyl benzotriazoles.

1-[(4-fluorophenyl)thiocarbamoyl]benzotriazole (2c)

Milling 200 mg of an equimolar mixture of 4-fluoroaniline (0.5109 mmol, 49.1 \( \mu L \)) and 1 (0.5109 mmol, 143.2 mg) with 50 \( \mu L \) of acetonitrile gave 2c in 99% yield.

Synthesis of $N$-monosubstitued thioureas

Synthesis of $N$-(4-bromophenyl)thiourea (3a)

200 mg of an equimolar mixture of $p$-bromoaniline (0.4422 mmol, 76.1 mg) and bis(benzotriazolyl)methanethione (0.4422 mmol, 123.9 mg) was ground in the presence of 50 µL of dry acetonitrile (LAG experiment, $\eta = 0.25$ µL mg$^{-1}$) using 10 mm stainless steel ball at 30 Hz for 10 minutes. IR spectrum of the crude reaction mixture was recorded to confirm the formation of 1-$[(4$-bromophenyl)thiocarbamoyl]benzotriazole 2a. The crude mixture was left in a well ventilated hood to allow acetonitrile to evaporate followed by the addition of ammonium chloride (1.7688 mmol, 94.6 mg) and sodium carbonate (1.7688 mmol, 187.5 mg). Milling was continued for 60 minutes. The obtained mixture was scraped off the walls of the grinding jar, suspended in distilled H$_2$O (10 mL) and stirred at r.t. for 30 minutes. The precipitate was collected by filtration, washed with distilled H$_2$O and the resulting solid was air-dried to give mono-thiourea 3a in 90% yield.

**Solution synthesis:**

N-(2-anthracenyl)thiourea was synthesized in two steps from 2-aminoanthracene following the literature procedure.¹

In a 50 mL two-necked flask fitted with a reflux condenser were placed ammonium thiocyanate (0.0285 mol, 2.17 g) and 13 mL of dry acetone. Benzoyl chloride (0.0259 mol, 3.0 mL) was added dropwise and the mixture was refluxed for 10 minutes. Then a solution of 2-aminoanthracene (0.0259 mol, 5.0 g) in a mixture of 100 mL of dry acetone and 60 mL of dry dimethylformamide was added through the dropping funnel within one hour. The obtained mixture was cooled on room temperature and poured with stirring into 300 mL of distilled water. The resulting precipitate was collected by filtration and air-dried overnight. Recrystallisation from toluene afforded N-(2-anthracenyl)-N'-benzoylthiourea in 55% yield.

Crystals of bis-thiourea were heated for one hour with excess of a boiling 10% solution of sodium hydroxide. After filtration, the resulting solid was washed with distilled water until neutral and air-dried to give mono-thiourea 3r in 95% yield.

**Synthesis of N-(9-anthracenyl)thiourea (3s)**

Anthracene-9-isothiocyanate (0.1765 mmol, 41.7 mg) was ground with ammonium chloride (1.4120 mmol, 75.5 mg) and sodium carbonate (1.4120 mmol, 149.7 mg) in the presence of 66.7 µL of dry acetonitrile (LAG experiment, η = 0.25 µL mg⁻¹) using 10 mm stainless steel ball at 30 Hz for 90 minutes. The crude mixture was left in a ventilated hood to allow acetonitrile to evaporate, then scraped off the walls of the grinding jar, suspended in distilled H₂O (10 mL) and stirred at r.t. for 30 minutes. The precipitate was collected by filtration, washed with distilled H₂O and the resulting solid was air-dried to give mono-thiourea 3s in 99% yield.

Anthracene-9-isothiocyanate was synthesised following the literature procedure.⁵

A 50 mL round-bottomed flask was charged with 9-aminoanthracene (2.204 mmol, 428.0 mg), THF (10 mL), and sodium hydride (4.104 mmol, 98.5 mg) in an ice bath under Ar atmosphere. Carbon disulphide (6.612 mmol, 400 µL) was added via syringe as the reaction was brought up to room temperature over 1 h. The mixture was then refluxed for 20 h. The mixture was then cooled on an ice bath, and TsCl (2.4244 mmol, 462.2 mg) and Et₃N (5.2295 mmol, 729.4 µL) were added. After 0.5 h, 1 N HCl (2 mL) and diethyl ether (2 mL) were added to the mixture. The aqueous layer was separated and back extracted with diethyl ether (10 mL). The organic layers were then combined, dried over Na₂SO₄ and filtered. The filtrate was concentrated in vacuo and the residue purified by column chromatography with hexane to remove impurities and finally dichloromethane as eluent to afford 117.0 mg of anthracene-9-isothiocyanate in 23% yield.

**Synthesis of N-(6-crysenyl)thiourea (3u)**

An equimolar mixture of 6-aminocrysenene (0.2394 mmol, 58.3 mg) and bis(benzotriazolyl)methanethione (0.2394 mmol, 67.1 mg) was ground in the presence of 31.4 µL of dry acetonitrile (LAG experiment, \(\eta = 0.25 \mu\text{L mg}^{-1}\)) using 10 mm stainless steel ball at 30 Hz for 90 minutes. The crude mixture was left in a well ventilated hood to allow acetonitrile to evaporate followed by ammonium chloride (0.9576 mmol, 51.2 mg) and sodium carbonate (0.9576 mmol, 101.5 mg) was ground neat using 10 mm stainless steel ball at 30 Hz for 60 minutes. The obtained mixture was scraped off the walls of the grinding jar, suspended in distilled H\(_2\)O (10 mL) and stirred at r.t. for 30 minutes. The precipitate was collected by filtration, washed with distilled H\(_2\)O and the resulting solid was air-dried to give mono-thiourea 3u in 99% yield.

Synthesis of N-(1-pyrenyl)thiourea (3v)

A mixture of 1-[(1-pyrenyl)thiocarbamoyl]benzotriazole 2v (0.3963 mmol, 150 mg), ammonium chloride (1.5852 mmol, 84.8 mg) and sodium carbonate (1.5852 mmol, 168.0 mg) was ground neat using 10 mm stainless steel ball at 30 Hz for 60 minutes. The obtained mixture was scraped off the walls of the grinding jar, suspended in distilled H₂O (10 mL) and stirred at r.t. for 30 minutes. The precipitate was collected by filtration, washed with distilled H₂O and the resulting solid was air-dried to give mono-thiourea 3v in 94% yield.

Synthesis of 1-(4-thioureidobenzyl)thiourea (7)

Synthesis of N,N'-bis(benzotriazole-1-thiocarbamoyl)-4-aminobenzylamine (5)

A mixture of 4-aminobenzylamine (0.5858 mmol, 71.6 mg, 66.4 µL) and bis(benzotriazolyl)methanethione (1.1716 mmol, 328.4 mg) was ground ground in the presence of 100 µL of dry acetonitrile (LAG experiment, η = 0.25 µL mg⁻¹) using 10 mm stainless steel ball at 30 Hz for 20 minutes. The crude mixture was left in a ventilated hood to allow acetonitrile to evaporate, then scraped off the walls of the grinding jar, suspended in distilled H₂O (20 mL) and stirred at r.t. for 30 minutes. The precipitate was collected by filtration, washed with distilled H₂O and the resulting solid was air-dried to give bis N-thiocarbamoyl benzotriazole 5 in 99% yield.

Note: ¹H and ¹³C NMR spectra, recorded in d₆-DMSO due to insolubility in other solvents, indicated decomposition of the product. However, the IR spectrum is consistent with the formation of a mixed aromatic-alkyl thiocarbamoyl benzotriazole (characteristic aromatic thiocarbamoyl benzotriazole peak at 1599 cm⁻¹ and benzyl thiocarbamoyl benzotriazole peaks at 1020 and 1003 cm⁻¹).

FTIR-ATR *ex situ* analysis of 2a amination under ball milling

**Figure S66.** FTIR-ATR analysis of NH$_4$Cl reactivity with thiocarbamoyl benzotriazole 2a. Aging of the equimolar mixture: a) initial sample, b) overnight aging. Neat grinding for 60 minutes using 10 mm stainless steel ball (c). Notably, NH$_4$Cl is unreactive towards 2a under aging or milling conditions.

**Figure S67.** FTIR-ATR spectra of the crude reaction mixtures after milling 4-bromophenylthiocarbamoyl benzotriazole 2a with only Na$_2$CO$_3$ (4 eq) for 10 minutes. LAG using water and ethanol results in decomposition of 2a into 4-bromophenyl isothiocyanate (absorption band between 2000–2200 cm$^{-1}$), while this process in LAG with acetonitrile and neat grinding is significantly slower.
Figure S68. FTIR-ATR spectra of the isolated products after 60 minutes milling 4-bromophenylthiocarbamoyl benzotriazole 2a with a) NH$_4$Cl(4 eq)/Na$_2$CO$_3$(5 eq) and b) NH$_4$Cl(4 eq)/Na$_2$CO$_3$(4 eq) as the ammonia source under LAG conditions using water. The analysis shows slightly better conversion to thiourea 3a in the case of an extra equivalent of Na$_2$CO$_3$, but still most of the thiocarbamoyl benzotriazole 2a remains unreacted.

Figure S69. FTIR-ATR spectra of the crude reaction mixtures after milling 4-bromophenylthiocarbamoyl benzotriazole 2a with NH$_4$Cl/Na$_2$CO$_3$ (4 eq) as the ammonia source under solvent-free conditions (neat grinding).

**Figure S71.** Calibration curve for different compositions of 2a/3a mixture simulating the conversion of 2a to 3a. The $y$-values were calculated from the peak areas of thiocarbamoyl benzotriazole 2a at 494 cm⁻¹ and thiourea 3a at 509 cm⁻¹.
