Supplementary Data

Figure S1. Establishment of a coculture interface by cell migration. 3T3 cells were seeded in neighboring wells of an Ibidi microwell insert and cultured overnight before insert removal. Images were acquired at 0 h (A), 24 h (B), and 48 h (C) after insert removal. Scale bar = 200 µm.

Figure S2. Automated analysis script detects the border of each cell population.

Figure S3. Two-well device. A single coverslip insert blocks both wells simultaneously.
