S1 General information and equipment

All reactions were performed under a dry atmosphere of argon using standard Schlenck techniques. All chemicals were received from commercial sources (Aldrich, Alfa Aesar, Acros) and used without further purification. Dichloromethane were distilled over P₂O₅ under an argon atmosphere. Thin layer chromatography (TLC) was performed on silica gel coated with fluorescent indicator. Chromatographic purifications were conducted using 40-63 μm silica gel. All mixtures of solvents are given in v/v ratio.

1H NMR (400.1 MHz) and 13C NMR (100.5 MHz) spectra were recorded on a Bruker Advance 400 MHz spectrometer, 1H NMR (300.1 MHz) and 13C NMR (75.5 MHz) or a Bruker Advance 300 MHz spectrometer with perdeuterated solvents with residual protonated solvent signals as internal references.

Absorption spectra were recorded using a dual-beam grating Schimadzu UV-3000 absorption spectrometer with a 1 cm quartz cell. The steady-state fluorescence emission and excitation spectra were obtained by using a Horiba S2 Jobin Yvon Fluoromax 4. All fluorescence spectra were corrected. Solvents for spectroscopy were spectroscopic grade and were used as received. All fluorescence spectra were corrected.

The fluorescence quantum yield (Φ_exp) was calculated from eq (1).

\[ Φ_{exp} = Φ_{ref} \times \frac{1}{I_{ref}} \times \frac{OD_{ref}}{OD} \times \frac{η^2}{η^2_{ref}} \]  

I denotes the integral of the corrected emission spectrum, OD is the optical density at the excitation wavelength, and η is the refractive index of the medium. The reference systems used were: Quinine Φ= 55% in H₂SO₄ 1N, λ_exc = 366 nm for dyes emitting below 480 nm, Rhodamine 6G, Φ= 88% in ethanol λ_exc = 488 nm for dyes emitting between 480 and 570 nm and cresyl violet, Φ= 55% λ_exc = 546 nm in ethanol for dyes emitting above 570 nm.

Luminescence lifetimes were measured on an Edinburgh Instruments spectrofluorimeter equipped with a R928 photomultiplier and a PicoQuant PDL 800-D pulsed diode connected to a GwInstect GFG- 8015G delay generator. No filter was used for the excitation. Emission wavelengths were selected by a monochromator. Lifetimes were deconvoluted with FS-900 software using a light-scattering solution (LUDOX) for instrument response. The excitation source was a laser diode (λ = 320 nm).
S2 Synthetic protocols

**Compound 1**

To a stirred solution of 1,3-dimethoxybenzene (1.5 g, 10.8 mmol), in CH$_2$Cl$_2$ (20 ml) was added dropwise a 1.0M solution of bromine in CH$_2$Cl$_2$ (2.30 mmol) at 0 °C under argon. The reaction was stirred for 30 min and progress was monitored by TLC. The product was then washed with saturated sodium thiosulfate and concentrated under vacuum to afford the brominated intermediate as a white solid which was used without further purification. 1.6N butyl-lithium in hexane (4.0 ml, 5.60 mmol) was syringed at room temperature to a stirred solution of the brominated intermediate in anhydrous ether (30 ml) under argon. The solution was stirred for 1 min. before anhydrous DMF (6.70 mmol) was added dropwise. The formed precipitate was stirred for 5 min before 10 ml of HCl (10%) was added. The stirring was continued for a further 15 min after which the precipitate was washed with water and extracted with ether. After solvent evaporation, the crude residue was purified by recrystallization in ethanol leading to compound 1 as a crystalline white powder (66% over 2 steps).

$^1$H NMR (300 MHz, CDCl$_3$) $\delta$ (ppm) = 10.27 (s, 2H, CHO), 8.34 (s, 1H, H$_a$), 6.45 (s, 1H), 4.02 (s, 6H, CH$_3$). $^{13}$C NMR (75 MHz, CDCl$_3$) $\delta$ (ppm) = 187.7, 167.5, 132.1, 119.0, 94.4, 56.3. ESI-HRMS calcd for C$_{10}$H$_{11}$O$_4$: 195.0652 (M+H) found 195.0643 (M+H).

**Compound 6**

To a solution of p-dimethoxybenzene (1.40 g, 10 mmol) and N,N,N’,N’-tetramethylethylenediamine (7.5 ml, 50 mmol) in diethyl ether (40 ml) was added n-butyllithium (1.6M solution in hexane, 32 ml, 50 mmol) at 0 °C under argon. The mixture was then refluxed for 24h. After the mixture was cooled down to room temperature, N,N-dimethylformamide (5 ml, 55 mmol) was added to the mixture, which was stirred overnight at room temperature. After addition of water (25 ml), the mixture was extracted with chloroform. The organic layer was dried over anhydrous MgSO$_4$, filtered, and concentrated under vacuum to give a brown oil which was further purified by recrystallization from dichloromethane/pentane to afford compound 6 (46%).

$^1$H NMR (300 MHz, CDCl$_3$) $\delta$ (ppm) = 10.50 (s, 2H, CHO), 7.46 (s, 2H), 3.94 (s, 6H, CH$_3$). $^{13}$C NMR (75 MHz, CDCl$_3$) $\delta$ (ppm) = 189.4, 155.9, 129.3, 111.1, 56.4.

**General procedures for the synthesis of DHBO 2, 3 and 7**

The mixture was stirred for 24 h at rt. After solvent evaporation, the crude residue was purified by silica gel chromatography eluting with CH$_2$Cl$_2$/Pet. Ether leading to the corresponding DHBO.
