General
Melting points were determined on a BUCHI Melting point apparatus and are uncorrected. $^1$H and $^{13}$C NMR spectra were recorded on Bruker 300 or 500 [300.13 MHz ($^1$H), 75.47 MHz ($^{13}$C) or 500.13 MHz ($^1$H), 125.77 MHz ($^{13}$C)] spectrometers with TMS as internal reference. Data for $^1$H NMR are recorded as follows: chemical shift (δ, ppm), multiplicity [s (singlet), d (doublet), t (triplet), q (quartet) and m (multiplet)], coupling constant (J, Hz) and integration. Data for $^{13}$C NMR are reported in terms of chemical shift (δ, ppm). Unequivocal $^1$H assignments were made with aid of 2D COSY ($^1$H/$^1$H), while $^{13}$C assignments were made on the basis of 2D HSQC ($^1$H/$^{13}$C) and HMBC experiments. Elemental analyses were obtained with a Carlo Erba 1108 CHNS analyser. High resolution mass spectra analysis (HRMS-ESI) were performed on a microTOF (focus) mass spectrometer (Bruker Daltonics, Bremen, Germany). Ions were generated using an Apollo II (ESI) source. Ionization was achieved by electrospray, using a voltage of 4500 V applied to the needle, and a counter voltage between 100 and 150 V applied to the capillary. Silica gel 60 F254 (Merck) was used for TLC, and the spots were detected with UV light (254 nm). Flash column chromatography was carried out on silica gel 60 (Merck).

$4^\prime$-methoxyacetophenone (450 mg, 3 mmol, 1 equiv) and 4-methoxybenzaldehyde (408 mg, 3 mmol, 1 equiv.) were dissolved in MeOH (40 mL). NaOH (240 mg, 6 mmol, 2 equiv) was added slowly. The reaction mixture was stirred at RT during 12 h, then water (10 mL) was added. The solid was collected by filtration, washed with water and methanol, and dried in air. The product was obtained without further purification as a pale yellow solid (437mg, 54%).

$^1$H NMR (300 MHz, CDCl$_3$, 25 °C): δ = 8.04 (d, $^3$J$_{H-H}$ 8.9 Hz, 2H, Harom), 7.78 (d, $^3$J$_{H-H}$ 15.6 Hz, 1H, CH=CH), 7.60 (d, $^3$J$_{H-H}$ 8.8 Hz, 2H, Harom), 7.43 (d, $^3$J$_{H-H}$ 15.6 Hz, 1H, CH=CH), 6.98 (d, $^3$J$_{H-H}$ 8.9 Hz, 2H, Harom), 6.94 (d, $^3$J$_{H-H}$ 8.8 Hz, 2H, Harom), 3.89 (s, 3H, OCH$_3$), 3.86 (s, 3H, OCH$_3$).

$3^\prime$-Chloro-$4^\prime$-methoxyacetophenone (50 mg, 0.27 mmol, 1 equiv) and 3-chloro-4-methoxybenzaldehyde (70 mg, 0.41 mmol, 1.5 equiv.) were dissolved in MeOH (10 mL). NaOH (43 mg, 1.08 mmol, 4 equiv) was added slowly. The reaction mixture was stirred under reflux during 4 h, cooled to room temperature, poured into ice and acidified with dilute HCl. The mixture was extracted with dichloromethane, washed with water, dried over sodium sulfate, and evaporated. The residue was purified by chromatography (dichloromethane/hexane: 2/1) by TLC to give the product as a yellow solid (76mg, 85%).

3-Chloro-4-methoxybenzaldehyde 4a

Reference for this compound: Commercial by Aldrich

A mixture of \(p\)-methoxybenzaldehyde (1.00 mL, 8.2 mmol, 1 equiv) and ammonium nitrate (0.13 g, 1.6 mmol, 0.2 equiv) in acetonitrile (10 mL) was stirred at room temperature. \(N\)-Chlorosuccinimide (4.36 g, 33 mmol, 4 equiv) was added slowly over 3 days. The solid obtained was filtered and the mixture was extracted with dichloromethane, washed with water and dried over Na\(_2\)SO\(_4\). The solvent was then evaporated under reduced pressure, and silica gel flash column chromatography (eluent: dichloromethane/Hexane: 1/1) of the residue gave the product as a white solid (0.62g, 45%).

1-(3-Chloro-4-methoxyphenyl)ethan-1-one 6a

Reference for this compound: Commercial by Aldrich

To a solution of 4'-methoxyacetophenone (1.0 g, 6.66 mmol) in glacial acetic acid (8 mL) was added 5% NaOCl in water (30 mL) dropwise. The mixture was stirred for 30 minutes. A solid was obtained, which was separated by filtration and purified over silica gel flash column chromatography (dichloromethane / petroleum ether 3/1). The solvent was completely evaporated, yielding 3'-chloro-4'-methoxyacetophenone (0.568 g, 3.08 mmol, 46%) as white crystals.

1H NMR (300 MHz, CDCl3, 25 ºC): δ = 8.00 (d, 4JH-H 2.2 Hz, 1H, Harom), 7.87 (dd, 4JH-H 2.2, 3JH-H 8.4 Hz, 1H, Harom), 6.97 (d, 3JH-H 8.4 Hz, 1H, Harom), 3.97 (s, 3H, OCH3), 2.56 (s, 3H, CCH3).

1-(3-Bromo-4-methoxyphenyl)ethan-1-one 6b

Reference for this compound: Commercial by Aldrich

A mixture of 4’methoxyacetophenone (1.00 g, 6.6 mmol, 1 equiv) and ammonium nitrate (0.10 g, 1.3 mmol, 0.2 equiv) in acetonitrile (10 mL) was stirred at room temperature. *N*-Bromosuccinimide (3.56 g, 20 mmol, 2 equiv) was added slowly over 3 days. The solid obtained was filtered and the mixture was extracted with dichloromethane, washed with water and dried over Na$_2$SO$_4$. The solvent was then evaporated under reduced pressure, and silica gel flash column chromatography (eluent: dichloromethane/ Hexane: 1/1) of the residue gave the product as a white solid (1.07 g, 71%).

Crystal structures

Single crystals with block shape of compound 2b and with needle shape of compound 2d were manually selected from the crystallization vial. A suitable single-crystal was mounted on a glass fiber with the help of silicon grease. Data were collected at 180(2) K on a Bruker X8 Kappa APEX II charge-coupled device (CCD) area-detector diffractometer (Mo Ka graphite-monochromated radiation, λ = 0.71073 Å) controlled by the APEX2 software package,\(^1\) and equipped with an Oxford Cryosystems Series 700 cryostream monitored remotely using the software interface Cryopad.\(^2\) Images were processed using the software package SAINT+\(^3\), and data were corrected for absorption by the multi-scan semi-empirical method implemented in SADABS.\(^4\) The structure was solved using the direct methods algorithm implemented in SHELXS-97,\(^5,6\) which allowed the immediate location of the majority of the atoms. All remaining non-hydrogen atoms were located from difference Fourier maps calculated from successive full-matrix least squares refinement cycles on \(F^2\) using SHELXL-97.\(^5,7\) All non-hydrogen atoms were successfully refined using anisotropic displacement parameters.

Hydrogen atoms bound to carbon were located at their idealized positions using appropriate HFIX instructions in SHELXL (43 for the aromatic and vinylic, 23 for the \(-\text{CH}_2-\) moieties and 13 for the chiral tertiary carbon atoms) and included in subsequent refinement cycles in riding-motion approximation with isotropic thermal displacements parameters \((U_{iso})\) fixed at 1.2 times \(U_{eq}\) of the atom to which they are attached.

Crystallographic data (excluding structure factors) for the structures reported in this paper have been deposited with the Cambridge Crystallographic Data Centre as supplementary publication No. CCDC 1057223-1057224.
