Fig. S1 shows TEM images of TiO$_2$ nanotube arrays with and without carbon doping. The channels of the undoped TiO$_2$ nanotube arrays were relatively clear and transparent, as shown in Fig. S1 a. Thus, the boundary lines and hollow cores can have highly different contrasts in TiO$_2$ nanotube arrays. However, after the carbon doping step the TiO$_2$ nanotube arrays were stained by a collection of small masses, as shown Fig. S1 b. These fully covered the TiO$_2$ nanotube arrays, causing the difference between the contrasts of the boundary lines and the hollow cores to decrease.
