1. Experimental details

Synthetic procedures were performed under Argon atmosphere, in dry solvent unless otherwise noted. All reagents and solvents were reagent grade and were used without further purification. Chromatographic purifications were performed using silica gel 60 SDS (particle size 0.040-0.063 mm). Analytical thin-layer chromatography was performed using Merck TLC silica gel 60 F254. \(^1\)H-NMR spectra were obtained on Bruker TopSpin AV-400 (400 MHz) spectrometer. Chemical shifts are reported in parts per million (ppm) relative to the solvent residual peak (CDCl\(_3\), 7.27 ppm). \(^13\)C-NMR chemical shifts (\(\delta\)) are reported relative to the solvent residual peak (CDCl\(_3\), 77.0 ppm). UV-Vis measurements were carried out on a Shimadzu UV 3600 spectrophotometer. For extinction coefficient determination, solutions of different concentration were prepared in CH\(_2\)Cl\(_2\) (HPLC grade) with absorption between 0.1-1 of absorbance using a 1 cm UV cuvette. The emission measurements were carried out on Cary Eclipse fluorescence spectrophotometer. Mass spectra (MALDI-TOF) were recorded on a VOYAGER DE™ STR mass spectrometer using dithranol as matrix and a ULTRAFLEX III mass spectrometer using DCTB+PMMANa2100 as matrix. Melting points are uncorrected.

The molecular geometries and frontier molecular orbitals of these new dyes have been optimized by density functional theory (DFT) calculations at the B3LYP/6-31G* level using Gaussian03W. S1 Cyclic voltammetry was performed in ODCB-acetonitrile (4:1) solutions. Tetrabutylammonium perchlorate (0.1 M as supporting electrolyte) were purchased from Acros and used without purification. Solutions were deoxygenated by argon bubbling prior to each experiment, which was run under argon atmosphere. Experiments were done in a one-compartment cell equipped with a platinum working microelectrode (\(\varnothing = 2\) mm) and a platinum wire counter electrode. An Ag/AgNO\(_3\) (0.01 M in CH\(_3\)CN) electrode was used as reference and checked against the ferrocene/ferrocenium couple (Fc/Fc\(^+\)) before and after each experiment.

The thermal stability was evaluated by TGA on a Mettler Toledo TGA/DSC Starte System under nitrogen, with a heating rate of 10 °C/min. Heating of crystalline samples leads to melting of the solids, but no recrystallization was observed.
