General remarks

$^1$H and $^{13}$C NMR spectra were recorded on a JEOL ECX 500 (500 MHz for $^1$H NMR, 125 MHz for $^{13}$C NMR) spectrometer, a JEOL ECA 500 (500 MHz for $^1$H NMR, 125 MHz for $^{13}$C NMR) spectrometer or a JEOL ECS 400 (400 MHz for $^1$H NMR, 100 MHz for $^{13}$C NMR). Chemical shifts are denoted in $\delta$ (ppm) relative to residual solvent peaks as internal standard (CDCl$_3$, $^1$H $\delta$ 7.26, $^{13}$C $\delta$ 77.0; DMSO-$d_6$, $^1$H $\delta$ 2.50, $^{13}$C $\delta$ 39.5; C$_6$D$_6$, $^1$H $\delta$ 7.16, $^{13}$C $\delta$ 128.0). IR spectra were recorded on a JASCO FT/IR-4100 spectrometer. ESI-TOF MS spectra were recorded on a JEOL T100LP mass spectrometer. Optical rotations were recorded on a JASCO P-2200 polarimeter. High-performance liquid chromatography (HPLC) experiments were performed with a JASCO HPLC system equipped with a PU-2089 or PU-2086 Plus intelligent pump. Ultrahigh-performance liquid chromatography (UHPLC) experiments were performed with a JASCO X-LC system. All reactions sensitive to air or moisture were carried out under argon atmosphere in dry, freshly distilled solvents under conditions, unless otherwise noted. THF, CH$_2$Cl$_2$, toluene, DMF and Et$_2$O were purified by Glass Contour solvent dispensing system (Nikko Hansen & Co., Ltd., Osaka, Japan). All other reagents were used as supplied unless otherwise stated. Analytical thin-layer chromatography (TLC) was performed using E. Merck Silica gel 60 F254 pre-coated plates. Flash column chromatography was performed using 40–50 $\mu$m Silica Gel 60N (Kanto Chemical Co., Inc.) or 32–53 $\mu$m Silica-gel BW-300 (Fuji Silysia Chemical Ltd.).

**Cytotoxicity assay**

**Cell culture**

P388 mouse leukemia cells were obtained from Institute of Development Aging and Cancer (Tohoku University). Cells were maintained in RPMI1640 growth medium [RPMI1640 with phenol red (Wako Pure Chemical Industries, Osaka, Japan), 10% fetal bovine serum, penicillin G (100 units/mL), streptomycin (100 µg/mL)] under atmosphere of 5% CO₂ at 37°C.

**Cytotoxicity assay against P388 cells**

Compounds 2a–2r were diluted in RPMI1640 growth medium [RPMI1640 with phenol red (Wako Pure Chemical Industries, Osaka, Japan), 10% fetal bovine serum, penicillin G (100 units/mL), streptomycin (100 µg/mL)] with 2% DMSO to various concentrations (5-fold serial dilutions). P388 cells were harvested at 4 °C by centrifugation at 1000 rpm for 3 min. The collected cells were resuspended into the growth medium at 2 × 10⁴ cells/mL. Aliquots of the former medium (2% DMSO, 100 µL) containing the peptides and the latter medium containing P388 cells (100 µL) were mixed in 96-well plates. The final concentration of P388 cells and DMSO were 1 × 10⁴ cells/mL and 1%, respectively. After incubation for 92 h under atmosphere of 5% CO₂ at 37 °C, the numbers of viable cells were determined by 3’-[1-[(phenylamino)-carbonyl]-3,4-tetrazolium]-bis(4-methoxy-6-nitro)benzene-sulfonic acid hydrate (XTT) assay. Phenazine methosulfate (PMS)/XTT solution in growth medium (PMS 1.53 mg/mL in Milli-Q/XTT 50 mg/mL in Milli-Q/growth medium = 1/2/47, 50 µL) were added to each well and further incubated for 4 h under atmosphere of 5% CO₂ at 37 °C. The absorbance of each well at 490 nm was measured using a Bio-Rad Benchmark microplate reader (Bio-Rad, CA, USA). The cytotoxicities were evaluated as IC₅₀ (nM) by means of 3 replicates, and the error values are shown in Figure S1. Sigmoidal curve fittings were performed on Graphpad Prism (Graphpad Software, CA, USA).

LogD evaluation

LogD values were evaluated by UHPLC (column: Accucore 150 C18 2.1 mm × 150 mm; column oven: 37 °C; flow rate: 0.2 mL/min; eluent: linear gradient from 35% to 75% i-PrOH/H2O containing 0.05% TFA over 32 min; detection: 226, 254 nm) (Figure S2). The column dead time was determined by injection of NaNO3 as a non-retained marker, and its retention time (t0) was 1.28 min. The standard curve was obtained by plotting the capacity factor [k = (tR − t0)/t0] of the four standard compounds [benzonitrile (tR = 2.23 min), toluene (tR = 8.92 min), biphenyl (tR = 15.61 min), n-butylbenzene (tR = 19.32 min)] versus the literature LogD values. The LogD values of 2a–2r were calculated from the retention times.
