1. General Information

Unless otherwise noted, all reagents were obtained commercially and used without further purification. Unless otherwise specified, all other reagents were purchased from Acros, Aldrich, Fisher, Adamas-beta Co. Ltd. or TCI and used without further purification. $^1$H NMR spectra was recorded at 400 MHz, $^{13}$C NMR spectra was recorded at 100 MHz. $^1$H NMR spectra was recorded with tetramethylsilane ($\delta = 0.00$ ppm) as internal reference; $^{13}$C NMR spectra was recorded with CDCl$_3$ ($\delta = 77.00$ ppm) or DMSO-$d_6$ ($\delta = 39.51$ ppm) as internal reference. Chemical shifts were reported in parts per million (ppm, $\delta$) downfield from tetramethylsilane. Proton coupling patterns are described as singlet (s), doublet (d), triplet (t), quartet (q), multiplet (m), and broad (br).

2. General Procedure for the Synthesis of Ethyl 2-(quinolin-2-yl)acetate derivatives

Procedure A$^1$

\[
\begin{align*}
\text{To a solution of 2-merhylquinoline (716 mg, 5 mmol) and diethyl carbonate (2.24 mL, 18.5 mmol) in anhydrous THF (8 mL), LDA (2.0 M, tetrahydrofuran solution) (7 mL, 14 mmol) was added dropwise under nitrogen atmosphere at -78 °C. The resulting solution was stirred at -78 °C for 1.5 h. After completion of the reaction, 5 mL water was added and the mixture was warmed gradually to rt. Then, 50 mL water was added again and the solution was extracted with ethyl acetate. The organic layer was washed with saturated sodium bicarbonate solution and brine, then dried over sodium sulfate. The solvent was removed under reduced pressure. The obtained residue was purified by column chromatography to give the compound as yellow liquid (940 mg, 87%).}

\]

Procedure B$^2$
To a solution of 6-bromo-2-merhylquinoline (1.11 g, 5 mmol) in anhydrous THF (20 mL), lithium hexamethyldisilazide (1 M, tetrahydrofuran solution) (20 mL, 20 mmol) was added dropwise under nitrogen atmosphere at -60 °C. The resulting solution was stirred below -60 °C for 30 min. To the reaction solution, diethyl carbonate (1.34 mL, 11 mmol) was added. Then the mixture was stirred at rt for 3 h. After the completion of the reaction, 1 N HCl was added. The reaction solution was extracted with ethyl acetate. The organic layer was washed with saturated sodium bicarbonate solution and brine, then dried over sodium sulfate. The solvent was removed under reduced pressure. The obtained residue was purified by column chromatography to give compound (1.51 g, 76%).

To a solution of ethyl 3-benzoyl-2-(2-methoxyphenyl)indolizine-1-carboxylate (5h, 1 mmol, 40 mg) in the solvent of dichloromethane (2 mL) was added BBr$_3$ (3 eq, 30 µL) dropwise for 15 min at -40 °C. The mixture was stirred for 2 h at the same
temperature. After the reaction was completed, excess BBr₃ was quench by water at -40 °C. Then the reaction was diluted with ethyl acetate in room temperature, washed sequentially with water. The organic layer was dried over Na₂SO₄, filtered and evaporated under reduced pressure. The residue was added 2.5 mL aq. KOH (1 mol/mL) and stirred for 2 h at 75 °C. The mixture was diluted with ethyl acetate, washed with water followed by brine. The organic layer was dried over Na₂SO₄, filtered and evaporated under reduced pressure and the residue was purified by Al₂O₃ (PE/EA = 50:1-20/1) to give 6h as a yellow solid in 61% yield.
