(I) General information

Materials:

The starting materials for dNTPs were purchased from Berry Associates and Alfa Aesar. All the other reagents and solvents were purchased from Sigma Aldrich. Enzyme, Terminal Deoxynucleotidyl Transferase (TdT), Recombinant 2500 UN and 5XTdT Buffer was purchased from affymetrix. Blunt end 750 base pair DNA was prepared in our laboratory by molecular cloning and amplification using PCR and purification by a Wizard® Plus SV Minipreps DNA Purification System, according to the manufacture’s protocol.

Characterization:

1H and 31P NMR spectra were recorded on a Varian (600 MHz) NMR spectrometer. HPLC (HEWALETT PACKARD Series 1100) measurements were done using c8 reverse phase column, with acetonitrile, water, triethyl ammonium bicarbonate Buffer (TEAB pH 8) as mobile phase. LCMS analysis was done in negative ion mode with water/methanol mobile phase on Agilent 1100 series. UV irradiation was done using New Port UV light source with 365 nm band pass filter (Thor Lab). 2% Agarose gel electrophoresis is used for the separation of DNA fragments and to monitor the stop-start DNA synthesis process. The images were taken by exposing the gel to ChemiDoc-It™2® Imager.
