1. General
All solvents and reagents were purchased from commercial sources and used without further purification. Reactions were monitored by thin-layer chromatography (TLC) on a plate of silica gel 60 F254 (E. Merck, Darmstadt, Germany) and detection by charring with sulfuric acid. Column chromatographies were performed on silica gel 60 (0.063-0.200 mm, E. Merck). 1H (300 MHz) and 13C (75.5 MHz) NMR spectra were recorded on Bruker AVANCE 300. Chemical shifts in NMR spectra are reported in parts per million from TMS. IR spectra were recorded on a Perkin-Elmer IRFT 1650 spectrometer. ESI-MS data were acquired using a HCT Ultra Ion Trap mass spectrometer (Bruker Daltonics, Bremen, Germany) or using a LCT Premier XE (Waters, Manchester, UK) for the complexes. Accurate mass measurements (HR-MS) were realized using a Synapt G2 HDMS (Waters, Manchester, UK) equipped with a lockspray electrospray (ESI) source. Experiments were achieved in positive or negative ion mode using protonated or deprotonated molecule of bombesine as internal reference (m/z 1619.8229 and 1617.8073 respectively). Circular dichroism spectral measurements were performed in a conventional quartz cell (light path 0.1) on a DC III Jobin Yvon spectropolarimeter equipped with a temperature controller. The temperature of the cell was kept constant at 25°C. Equimolar solutions of gadolinium complexes and guest were prepared in water. Circular dichroism spectra were measured at 0.2 μmol/dm³.

Under nitrogen atmosphere, 2\textsuperscript{1}-\textit{O}-methyl-3-(4-(3-propyl)phenyl)propanoate-heptakis-(6-\textit{O}-ethoxycarboxymethyl-2,3-di-\textit{O}-methyl)-\textit{β}-cyclodextrin 3d (60 mg, 0.028 mmol) was dissolved in methanol (5 mL) and a solution of sodium hydroxide (0.6 mL, 0.570 mmol) was added. The reaction mixture was stirred for 18 hours at room temperature. Solvents were evaporated, water (3 mL) was added, and the solution was filtered on Dowex 50WX8-100 (H\textsuperscript{+}). Lyophilization of the solution gave the desired product as a white powder (50 mg, 92\% yield).

To a solution of 21-O-methyl-3-(4-(3-propyl)phenyl)propanoate-heptakis-(6-O-carboxymethyl-2,3-di-O-methyl)-\(\beta\)-cyclodextrin 3 (25 mg, 0.013 mmol) in 1.7 mL of deionized water (7.64 mM), a solution of GdCl\(_3\).6.H\(_2\)O (3.42 mg, 0.013 mmol) in 0.43 mL of deionized water (30.23 mM) was added in three portions. The pH was adjusted to 7.0 after each addition using a 1 M sodium hydroxide solution. The reaction mixture was stirred at room temperature for 18 hours. The pH was then adjusted to 8.5. The residual lanthanide was precipitated, centrifuged and filtered through a 0.2 \(\mu\)m membrane. The resulting solution was lyophilized to give quantitatively the desired product as a light yellow product (98% yield).

4. Relaxivity measurements

Contrast agents 1(Gd), 2(Gd) or 3(Gd) were diluted (1, 0.5, 0.25, 0.125, 0.0625 mM) in TRIS buffer (10 mM TRIS, 154 mM NaCl, pH 7.4). 2(Gd)+4 and 1(Gd)+4 were prepared in TRIS buffer. The guest was completely soluble in TRIS buffer after the addition of contrast agents and stirred for 30 min. Water proton relaxation times (T₁, T₂) were measured on a minispec mq20 (Bruker, Germany) spectrometer operating at 20 MHz and the relaxivity values were calculated by plotting the curves of 1/T as function of the concentration. Relaxation values were measured three times and the average has been calculated. The temperature was kept at 37°C with a Julabo ED Heating Immersion Circulators (uncertainty ± 0.1°C).
