2 Synthesis of Polymers and Polymer Topologies

2.1 Synthesis of PSTY₂₈-Br (6), by ATRP
Styrene (11.2 g, 1.0×10⁻¹ mol), PMDETA (0.24 mL, 1.1×10⁻³ mol), CuBr₂/PMDETA (6.1×10⁻² g, 2.5×10⁻⁴ mol) and initiator (0.3 g, 1.5×10⁻³ mol) were added to a 25 mL schlenk flask equipped with a magnetic stirrer and purged with argon for 30 min to remove oxygen. Cu(I)Br (0.16 g, 1.1×10⁻³ mol) was then carefully added to the solution under an argon blanket. The reaction mixture was further degassed for 5 min and then placed into a temperature controlled oil bath at 80 °C. After 3 h, an aliquot was taken to check the conversion. The reaction was quenched by cooling to 0 °C in ice bath, exposed to air, and diluted with THF (ca. 3 fold to the reaction mixture volume). The copper salts were removed by passage through an activated basic alumina column. The solution was concentrated by rotary evaporation and the polymer was recovered by precipitation into large volume of MeOH (20 fold excess to polymer solution) and vacuum filtered two times. The polymer was dried under high vacuum overnight for 24 h at 25 °C; SEC (Mₙ = 2820, PDI = 1.10; see SEC
trace in Figure S6) (Scheme S5; Table S1). Final conversion was calculated by gravimetry of 40%; 
\(^1\)H NMR (Figure S7) and MALDI-ToF (Figure S8).

**Scheme S5**: Synthetic route for the preparation of alkyne wedge dendron (11)

Conditions: (a) **Azidation**: NaN\(_3\) in DMF at 25 °C, (b) **Click (feed)**: CuBr, PMDETA in toluene by feed at 50 °C, **Click (25 °C)**: CuBr, PMDETA in toluene at 25 °C (one pot).

2.2 Synthesis of PSTY\(_{28}\)-N\(_3\) (7) by Azidation with NaN\(_3\)
Polymer PSTY\(_{28}\)-Br 6 (3.5 g, 1.2×10\(^{-3}\) mol) was dissolved in 15 mL of DMF in a 20 mL reaction vessel equipped with a magnetic stirrer. To this solution NaN\(_3\) (1.6 g, 2.4×10\(^{-2}\) mol) was added and the mixture stirred for 24 h at 25 °C. The polymer solution was directly precipitated into MeOH/H\(_2\)O (95/5, v/v) (20-fold excess to polymer solution) from DMF, recovered by vacuum filtration and washed exhaustively with water and MeOH. The polymer was dried under high vacuum for 24 h at 25 °C; SEC (\(M_n = 2900,\) PDI = 1.10; Figure S9) (Scheme S5; Table S1), and was further characterized by \(^1\)H NMR (Figure S10) and MALDI-ToF (Figure S11).

2.3 Synthesis of (≡)\(_2\)PSTY\(_{20}\)-Br (8) by ATRP
Styrene (9.0 g, 8.6×10\(^{-2}\) mol), PMDETA (0.27 mL, 1.3×10\(^{-3}\) mol), CuBr\(_2\)/PMDETA (1.0×10\(^{-1}\) g, 2.6×10\(^{-4}\) mol) and initiator (0.6 g, 2.5×10\(^{-3}\) mol) were added to a 20 mL schlenk tube equipped with a magnetic stirrer and purged with argon for 30 min to remove oxygen. Cu(I)Br (0.18 g, 1.2×10\(^{-3}\) mol) was then carefully added to the solution under an argon blanket. The reaction mixture was further degassed for 5 min and then placed into a temperature controlled oil bath at 80 °C. After 2 h, an aliquot was taken to check the conversion. The reaction was quenched by cooling to 0 °C in ice
bath, exposed to air, and diluted with THF (ca. 3 fold to the reaction mixture volume). The copper salts were removed by passage through an activated basic alumina column. The solution was concentrated by rotary evaporation and the polymer was recovered by precipitation into large volume of MeOH (20 fold excess to polymer solution) and vacuum filtered two times. The polymer was dried under high vacuum for 24 h at 25 °C; SEC ($M_n = 2300, \text{PDI} = 1.09$; see SEC trace in Figure S12) (Scheme S5; Table S1). Final conversion was calculated by gravimetry 41%; $^1$H NMR (Figure S13) and MALDI-ToF (Figure S14).

2.4 Synthesis of (PSTY$_{28}$)$_2$-PSTY$_{20}$-Br (9) by CuAAC

In a separate vial ($\equiv$)$_2$-PSTY$_{20}$-Br 8 (0.5 g, $2.1 \times 10^{-4}$ mol) was dissolved in 3.0 mL of dry toluene. Cu(I)Br ($3.1 \times 10^{-2}$ g, $2.1 \times 10^{-4}$ mol) was taken in a 20 mL schlenk tube equipped with magnetic stirrer wrapped with Cu wire (0.25 g, $3.9 \times 10^{-3}$ mol). After purging all these vessels for 30 min, polymer solution 7 was transferred to the schlenk tube by applying argon pressure using double tip needle, and the schlenk tube was placed in a temperature controlled oil bath at 50 °C. Polymer solution 8 was feed to the schlenk flask using a syringe pump over a period of 60 min (feed rate was set at 20 µL/min). The reaction was stopped after a additional 60 min and diluted with THF, and the copper slats were removed by passage through an activated basic alumina column. The solvent was removed by rotary evaporator and the polymer recovered by precipitation in 20-fold excess of MeOH, collected by vacuum filtration and washed exhaustively with MeOH. The polymer was dried under high vacuum for 24 h at 25 °C; SEC ($M_n = 6990, \text{PDI} = 1.13$; Figure 1A) and Triple Detection SEC ($M_n = 8590, \text{PDI} = 1.014$) (Scheme S5; Table S1). The polymer was further characterized by $^1$H NMR (Figure S15) and MALDI-ToF (Figure 2A).
2.5 Synthesis of (PSTY$_{28}$)$_2$-PSTY$_{20}$-N$_3$ (10) by Azidation with NaN$_3$

To this solution NaN$_3$ (2.3×10$^{-1}$ g, 3.5×10$^{-3}$ mol) was added and the mixture stirred for 24 h at 25 °C. The polymer solution was directly precipitated into MeOH/H$_2$O (95/5, v/v) (20-fold excess to polymer solution) from DMF, recovered by vacuum filtration and washed exhaustively with water and MeOH. The polymer was dried under high vacuum for 24 h at 25 °C; SEC ($M_n$ = 7280, PDI = 1.11; Figure S16) and Triple Detection SEC ($M_n$ = 8680, PDI = 1.01) (Scheme S5; Table S1). The polymer was further characterized by $^1$H NMR (Figure S17) and MALDI-ToF (Figure 2B).

2.6 Synthesis of (PSTY$_{28}$)$_2$-PSTY$_{20}$≡ (11) by CuAAC
Polymer (PSTY$_{28}$)$_2$-PSTY$_{20}$-N$_3$ 10 (1.3 g, 1.6×10$^{-4}$ mol) and propargyl ether (3.0×10$^{-1}$ g, 3.2×10$^{-3}$ mol) and PMDETA (3.3×10$^{-2}$ mL, 1.6×10$^{-4}$ mol) were dissolved in 6 mL of dry toluene in a vial. CuBr (2.3×10$^{-2}$ g, 1.6×10$^{-4}$ mol) was added to a 10 mL schlenk flask equipped with magnetic stirrer wrapped with Cu wire (0.25 g, 3.9×10$^{-3}$ mol) and both reaction vessels were purged with argon for 20 min. The polymer solution was then transferred to CuBr flask by applying argon pressure using double tip needle. The flask was placed in a temperature controlled oil bath at 25 °C for 1.5 h. The reaction was diluted with THF and passed through alumina column to remove copper salts. Solvent was removed by rotary evaporator and precipitated in excess of MeOH and filtered. The polymer was dried under high vacuum for 24 h at 25 °C; SEC ($M_n$ = 7510, PDI = 1.10). Cu(I)Br (0.14 g, 9.7×10$^{-4}$ mol) was then carefully added to the solution under an argon blanket. The reaction mixture was further degassed for 5 min and then placed into a temperature controlled oil bath at 80 °C. After 6 h, an aliquot was taken to check the conversion. The reaction was quenched by cooling to 0 °C in ice bath, exposed to air, and diluted with DCM (ca. 3 fold to the reaction mixture volume). The copper salts were removed by passage through an activated basic alumina column. The solution was concentrated by rotary evaporation and the polymer was recovered by precipitation into large volume of MeOH (20 fold excess to polymer solution) and vacuum filtration two times. The polymer was dried in high vacuo overnight at 25 °C, for 12 ($M_n = 3220$, PDI = 1.07; see SEC trace in Figure S20). Final conversion was calculated by gravimetry 47%. The polymer was further characterized by $^1$H NMR (Figure S21) and MALDI-ToF (Figure S22). Another batch of ≡(HO)-PSTY$_{25}$-Br, 12b ($M_n = 3150$, PDI = 1.07; SEC Figure S23; $^1$H NMR Figure S24 and MALDI-ToF Figure S25) was also synthesized by following similar procedure.

Cu(I)Br (0.12 g, 8.1×10$^{-4}$ mol) was then carefully added to the solution under an argon blanket. The reaction mixture was further degassed for 5 min and then placed into a temperature controlled oil bath at 80 °C. After 4 h, an aliquot was taken to check the conversion. The reaction was quenched by cooling to 0 °C in ice bath, exposed to air, and diluted with THF (ca. 3 fold to the reaction mixture volume). The copper salts were removed by passage through an activated basic alumina column. The solution was concentrated by rotary evaporation and the polymer was recovered by precipitation into large
volume of MeOH (20 fold excess to polymer solution) and vacuum filtration two times. The polymer was dried in high vacuo overnight at 25 °C, SEC (M_n = 2890, PDI = 1.11; see SEC trace in Figure S26) (Table S1). Final conversion was calculated by gravimetry 53%. The polymer was further characterized by 1H NMR (Figure S27) and MALDI-ToF (Figure S28).

**Scheme S6: Synthetic route for the preparation of cyclic alkyne (17)**

Conditions: (a) Azidation: NaN_3 in DMF at 25 °C, (b) Cyclization: CuBr, PMDETA in toluene by feed at 25 °C, (c) Bromination: 2-BPB, TEA in THF; 0 °C- RT. (d) Click (25 °C): CuBr, PMDETA in toluene at 25 °C (one pot).

### 2.9 Synthesis of ≡(HO)-PSTY_{25}-N_3 (13) by Azidation with NaN_3

Polymer 12c (2.9 g, 1.0×10^{-3} mol) was dissolved in 15 mL of DMF in a 20 mL reaction vessel equipped with a magnetic stirrer. To this solution NaN_3 (1.6 g, 2.4×10^{-2} mol) was added and the mixture stirred for 24 h at 25 °C. The polymer solution was directly precipitated into MeOH/H_2O (95/5, v/v) (20-fold excess to polymer solution) from DMF, recovered by vacuum filtration and washed exhaustively with water and MeOH. The polymer was dried under high vacuum for 24 h at 25 °C; SEC (M_n = 2880, PDI = 1.11; Figure S29) (Table S1). The polymer was further characterized by 1H NMR (Figure S30) and MALDI-ToF (Figure S31).

### 2.10 Synthesis of c-PSTY_{25}-OH (14)

Polymer 13 (2.0 g, 6.667×10^{-4} mol) in 80.0 ml of dry toluene and 6.97 mL of PMDETA (33.35×10^{-3} mol) in 80 mL of dry toluene in another flask were purged with argon for 45 min to remove oxygen. 4.78 g of CuBr (33.35×10^{-3} mol) was taken in a 250 mL of dry schlenk flask and maintained under
an argon flow in the flask at the same time. A PMDETA solution was transferred to CuBr flask by applying argon pressure using a double tip needle to prepare CuBr/PMDETA complex. After complex formation, the polymer solution was added via syringe pump using a syringe with pre-filled argon. The feed rate of argon was set at 1.24 mL/min. After the addition of the polymer solution (after 65 min), the reaction mixture was further stirred for 3 h. At the end of this period (i.e., feed time plus an additional 3 h), toluene was evaporated by air-flow and the copper salts were removed by passage through an activated basic alumina column by adding few drops of glacial acetic acid. The solvent was removed by rotary evaporator and the polymer was recovered by precipitation into MeOH (20 fold excess to polymer solution) and collected by vacuum filtration followed by exhaustive washing with MeOH. The polymer was dried under high vacuum for 24 h at 25 °C. A small fraction of crude product was purified by preparative SEC for characterization. <sup>a</sup>The molecular weight distribution from SEC (RI detector) was based on a PSTY calibration curve. <sup>b</sup>CuAAC coupling efficiency was determined from the RI SEC traces, and calculated as follows: purity (LND)/max. purity by theory × 100. <sup>c</sup>The molecular weight distribution determined from DMAc Triple Detection SEC with 0.03 wt % of LiCl as eluent. <sup>d</sup>PDI values from triple detection underestimate the true PDI values since light scattering is less sensitive to the low molecular weight part of the distribution. <sup>e</sup>(Mn<sub>RRI</sub>/Mn<sub>TD</sub>).
