| Figure S12. FTIR spectrum of 2 | S10 |
| Figure S13. FTIR spectrum of a clean gold electrode..... | S10 |
| Figure S14. FTIR of Au + FcPyr..... | S11 |
| Figure S15. Cyclic voltammetry of clean gold in 0.1 M HClO_4 | S11 |
| Figure S16. Cyclic voltammogram of a pyrene-functionalized thiol chemisorbed on a gold substrate in HClO_4 | S12 |
| Figure S17. Cyclic voltammogram of 2 in CH_3CN | S12 |
| Figure S18. Variable scan rate cyclic voltammograms of 2 in CH_3CN | S13 |
| Figure S19. Current vs. square root of scan rate plot of 2 from Figure S18..... | S14 |
| Figure S20. Voltammogram with 100 oxidation/reduction cycles of a pyrene- functionalized gold substrate with 2 adsorbed to the surface in 0.1 M HClO_4 | S15 |
| Table S1. Calculated surface concentrations of 2 for oxidative and reductive waves at various scans from the voltammogram in Figure S20..... | S16 |
| Figure S21. Cyclic voltammogram of a clean gold substrate submerged in a CH_2Cl_2 solution of 2 and rinsed with CH_3CN | S17 |

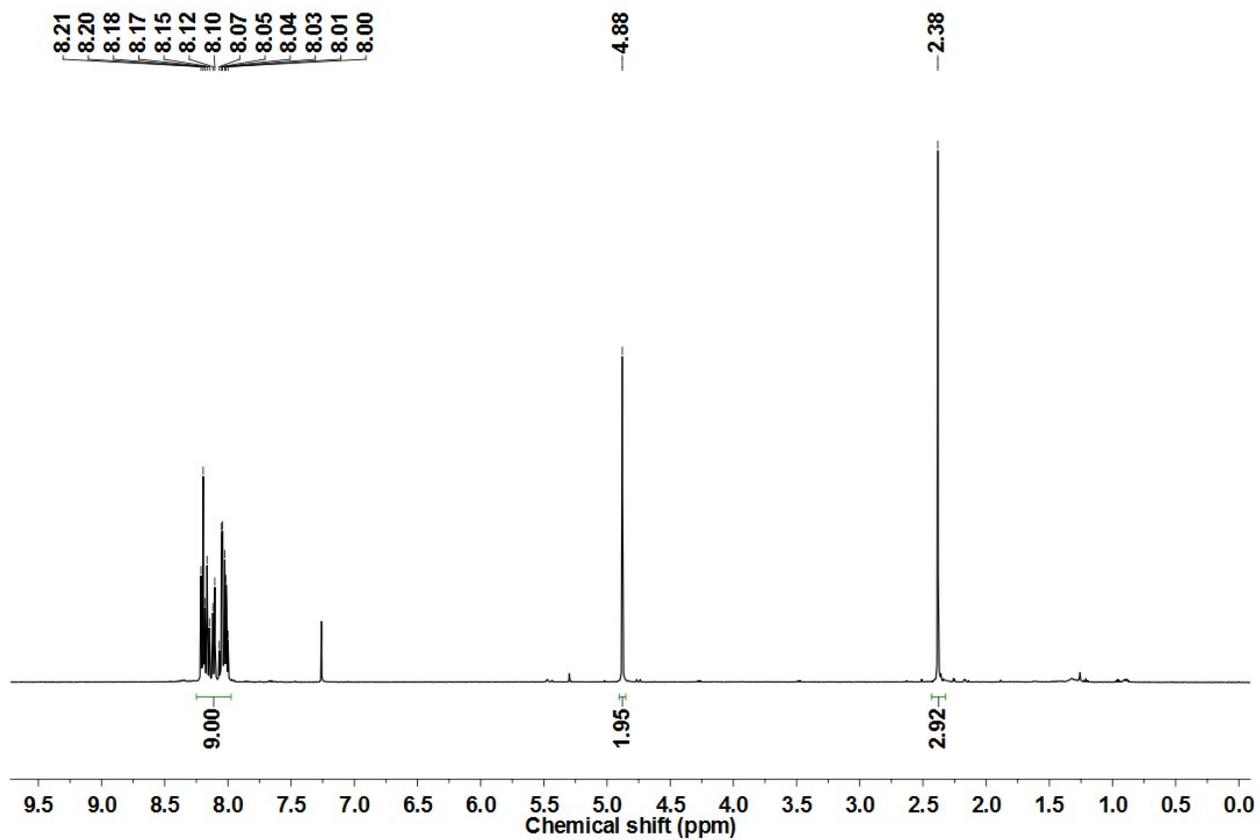

Figure S1. ¹H NMR spectrum of 1 in CDCl₃.

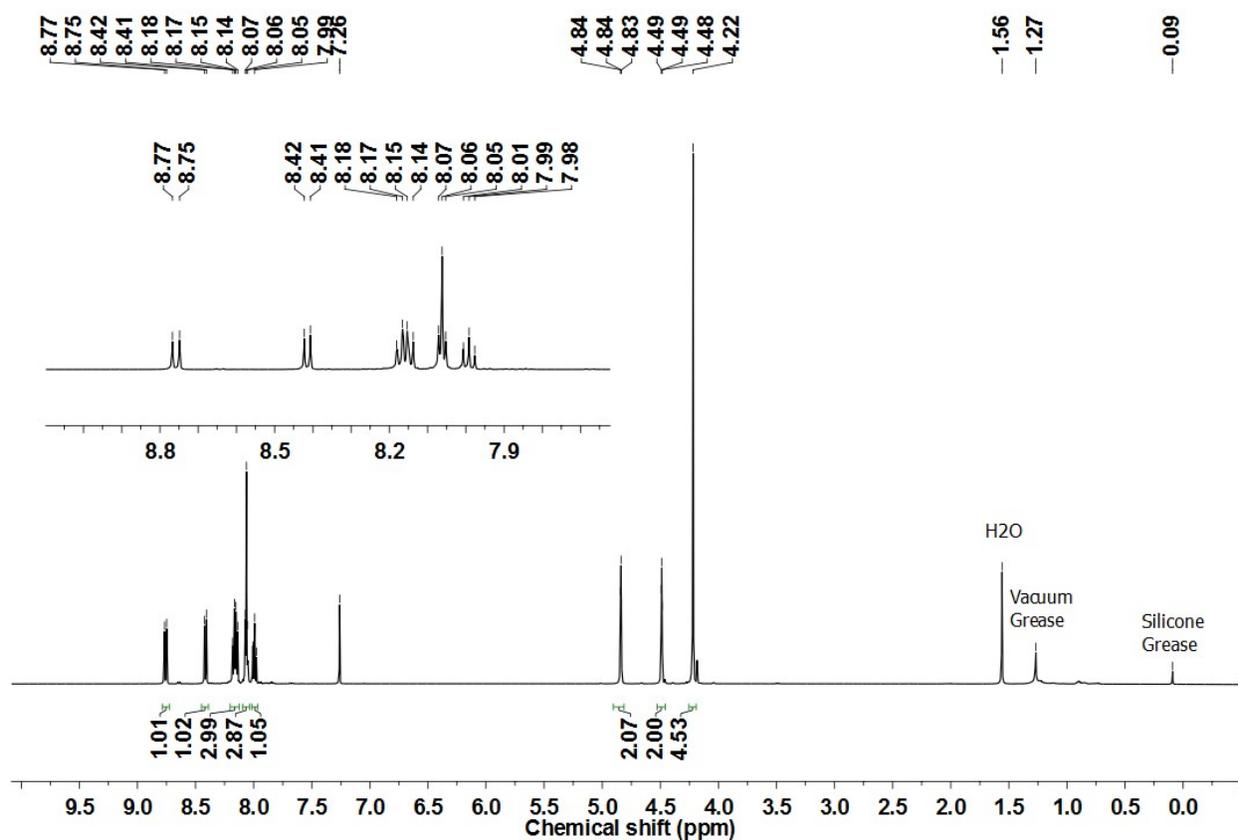

Figure S3. ^1H NMR spectrum of **2** in CDCl_3 .

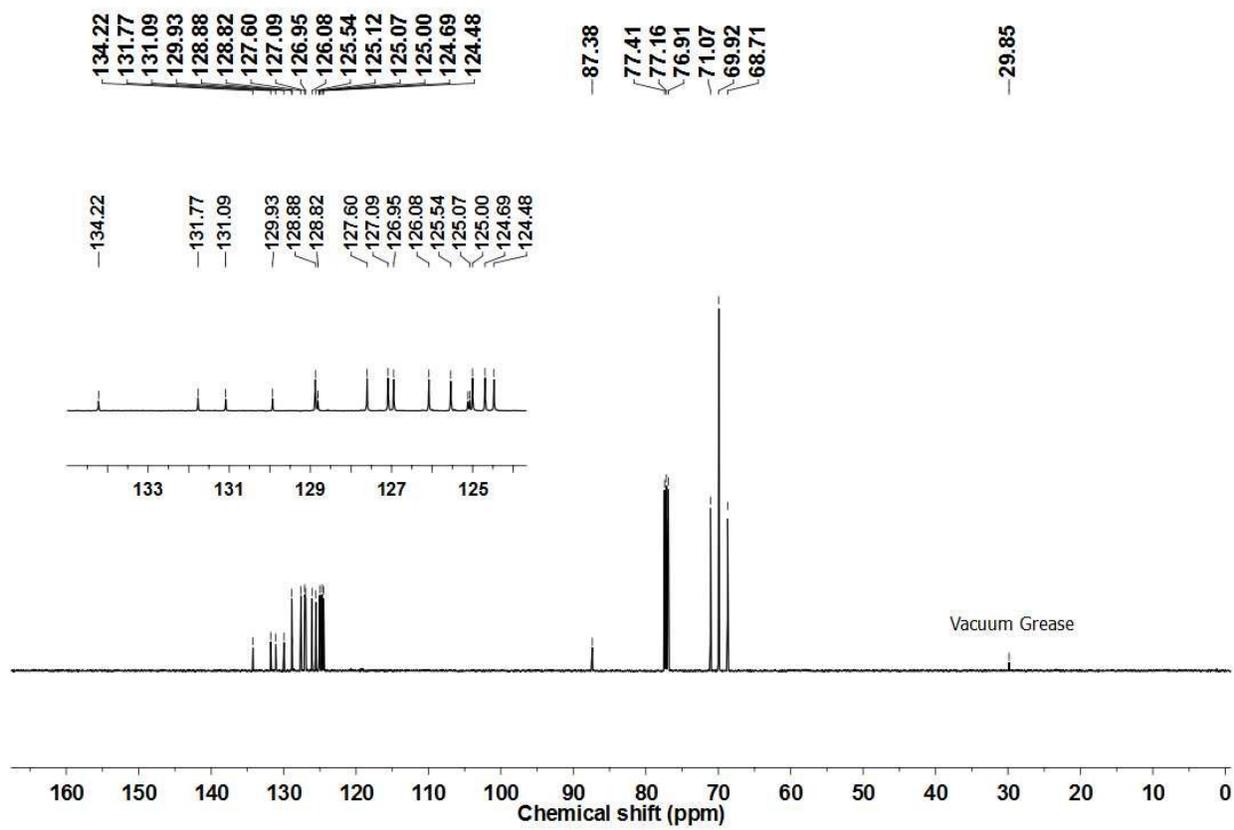

Figure S4. ^{13}C NMR spectrum of **2** in CDCl_3 .

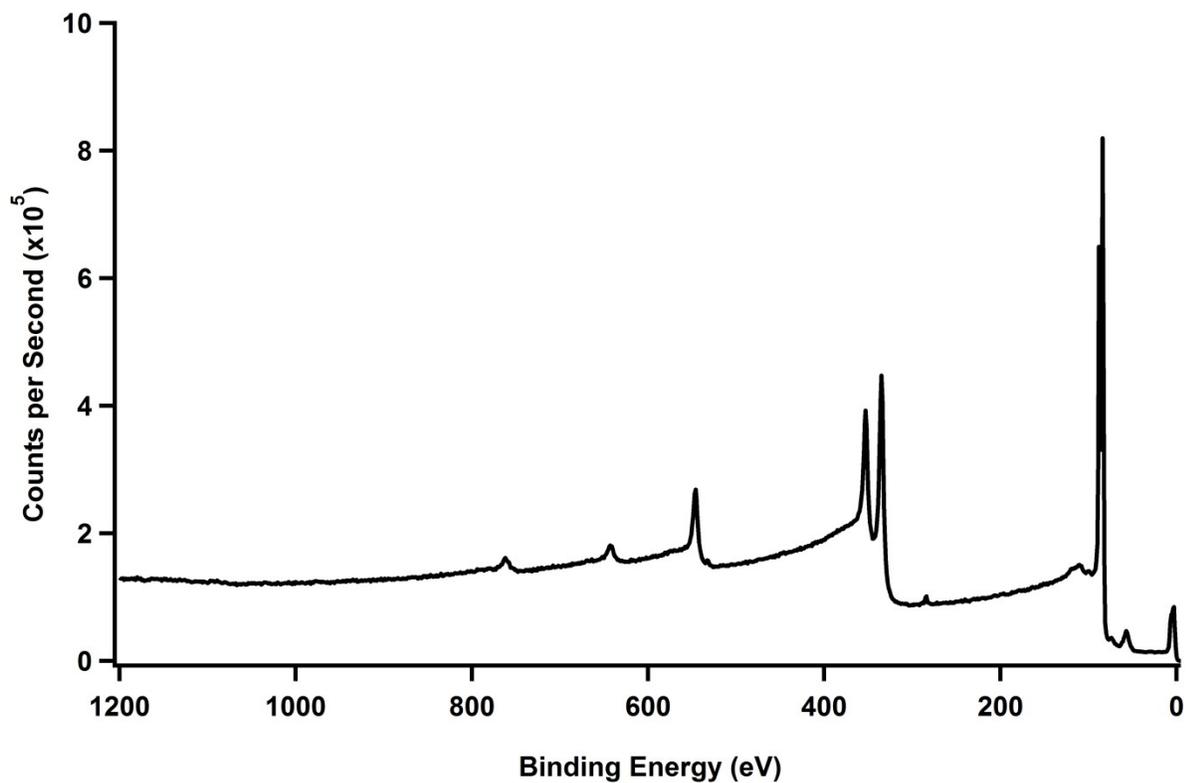

Figure S5. Survey XP spectrum of clean gold.

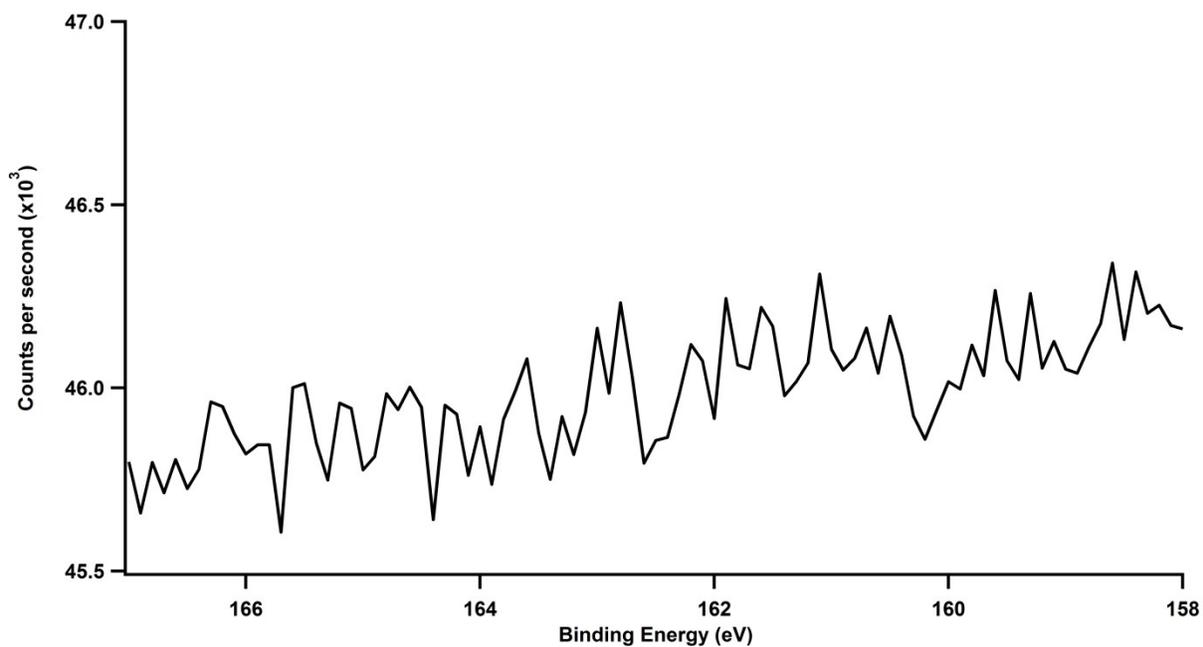

Figure S6. S 2p XP spectrum of clean gold.

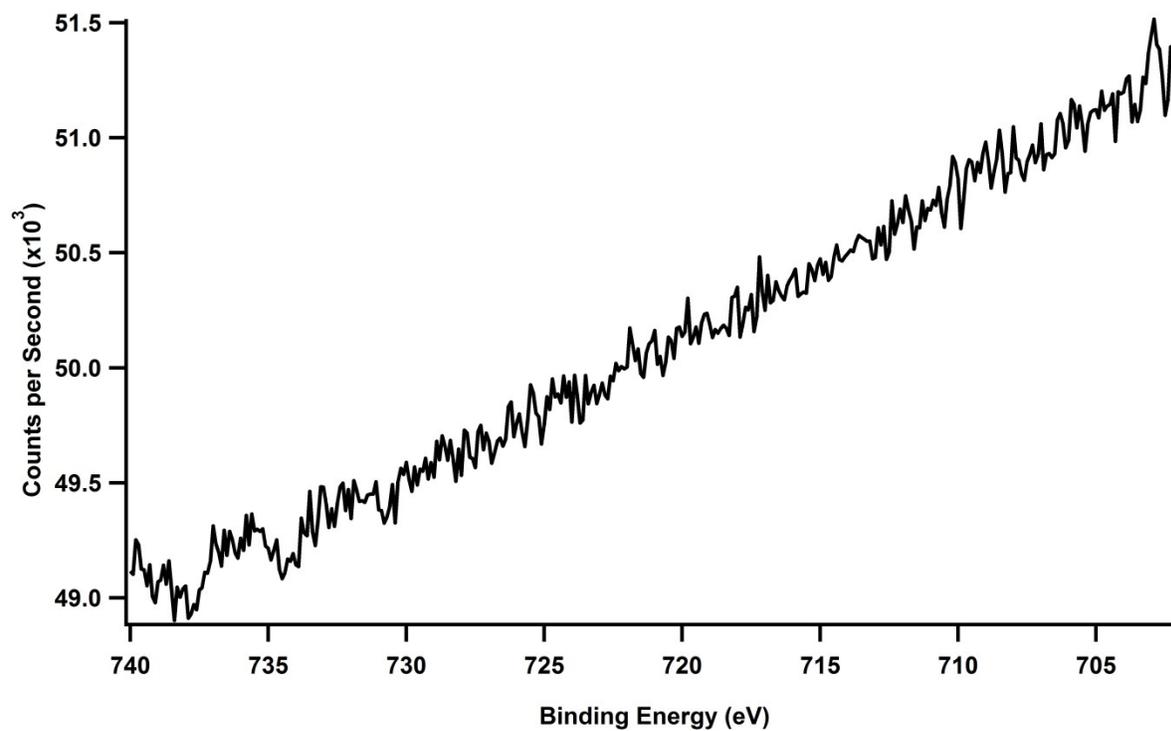

Figure S7. Fe 2p XP spectrum of clean gold.

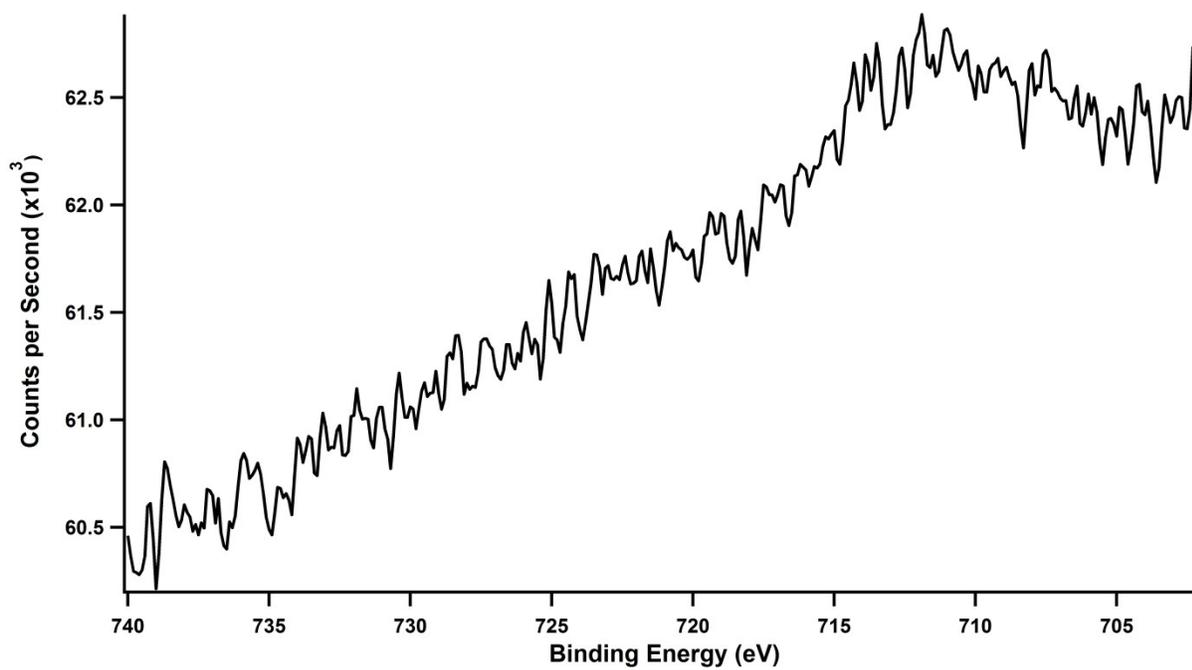

Figure S8. Fe 2p XP spectrum of gold upon covalent attachment of thiol-functionalized pyrene.

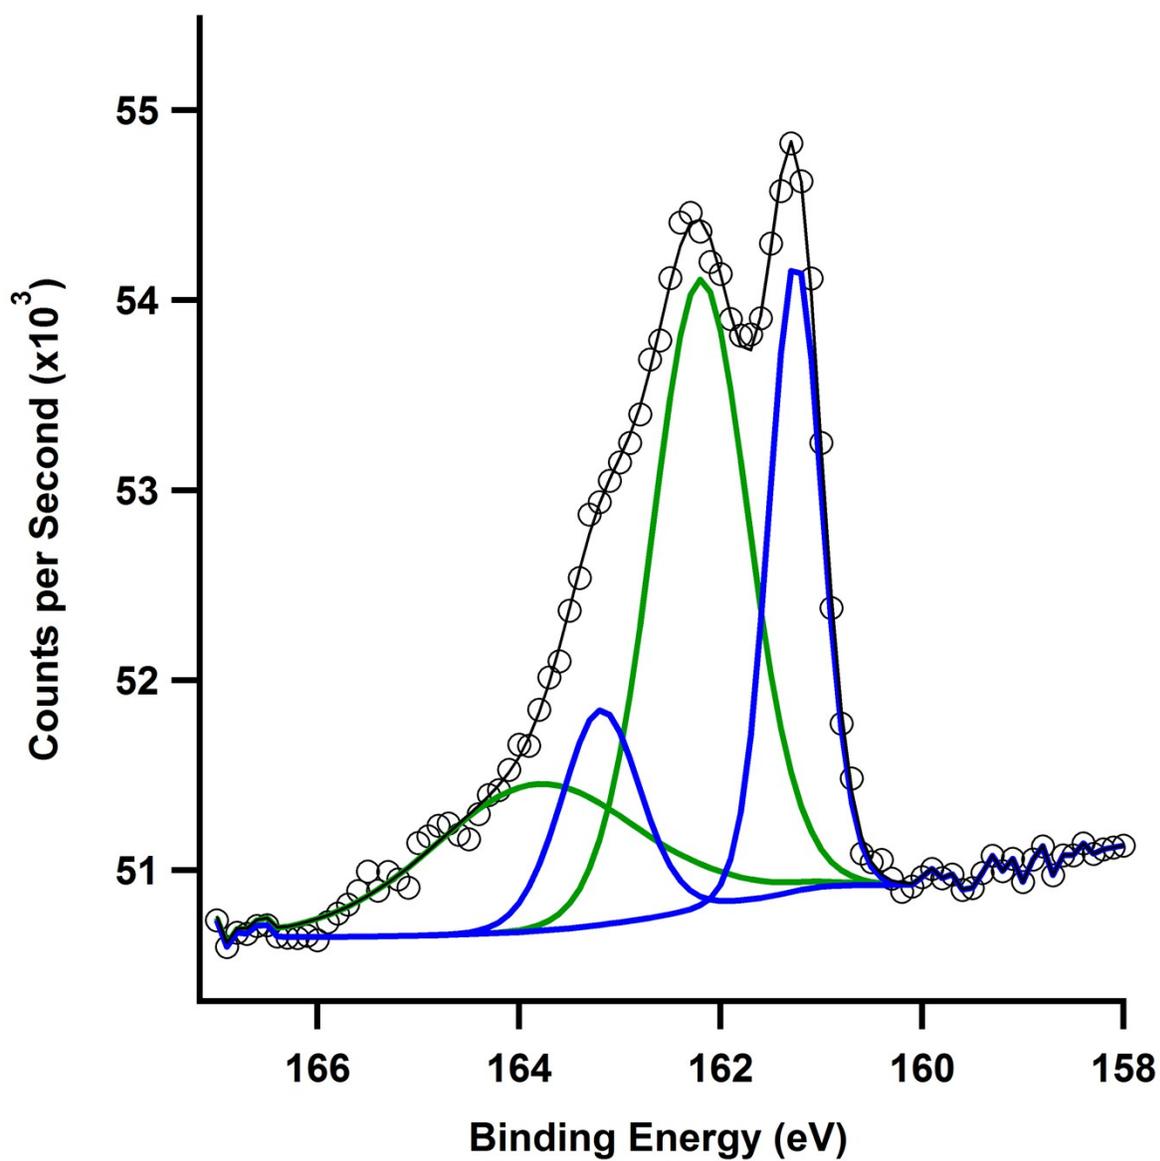

Figure S9. S 2p XP spectrum of gold upon covalent attachment of thiol-functionalized pyrene.

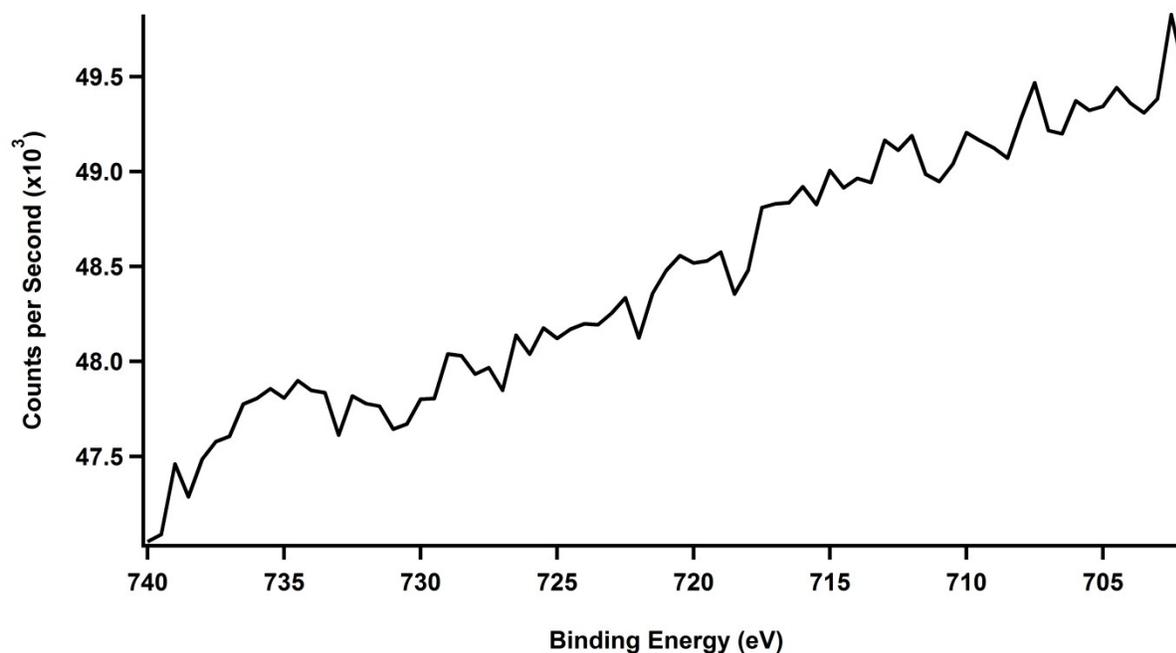

Figure S10. Fe 2p XP spectrum of clean gold treated with **2** and rinsed with CH₃CN. The pyrene modification to the surface is not present in this sample.

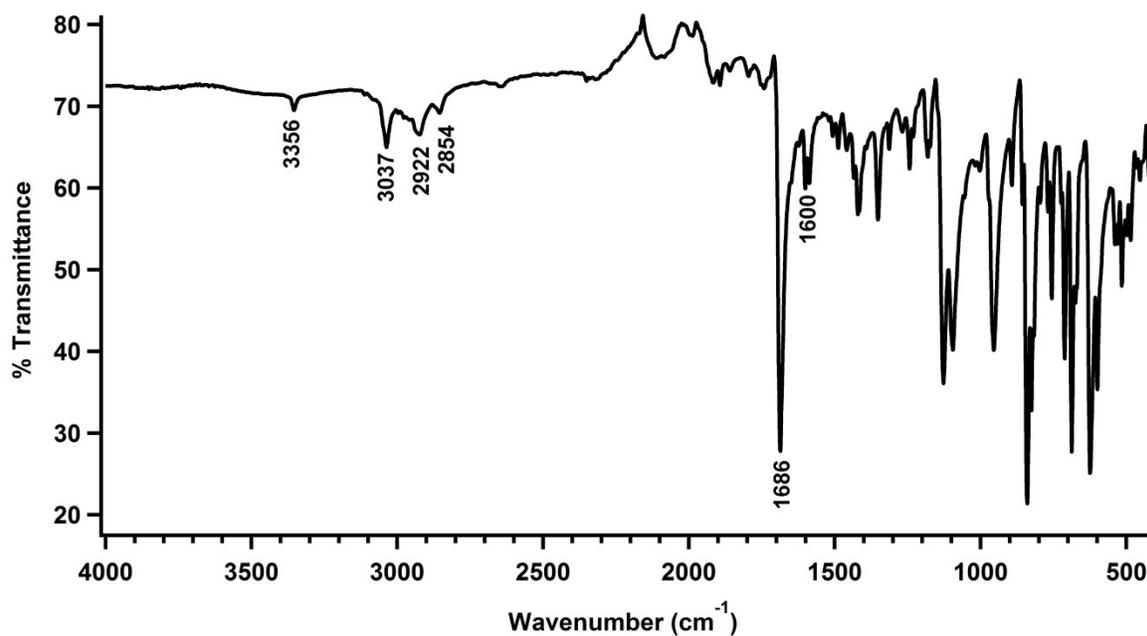

Figure S11. FTIR spectrum of **1**.

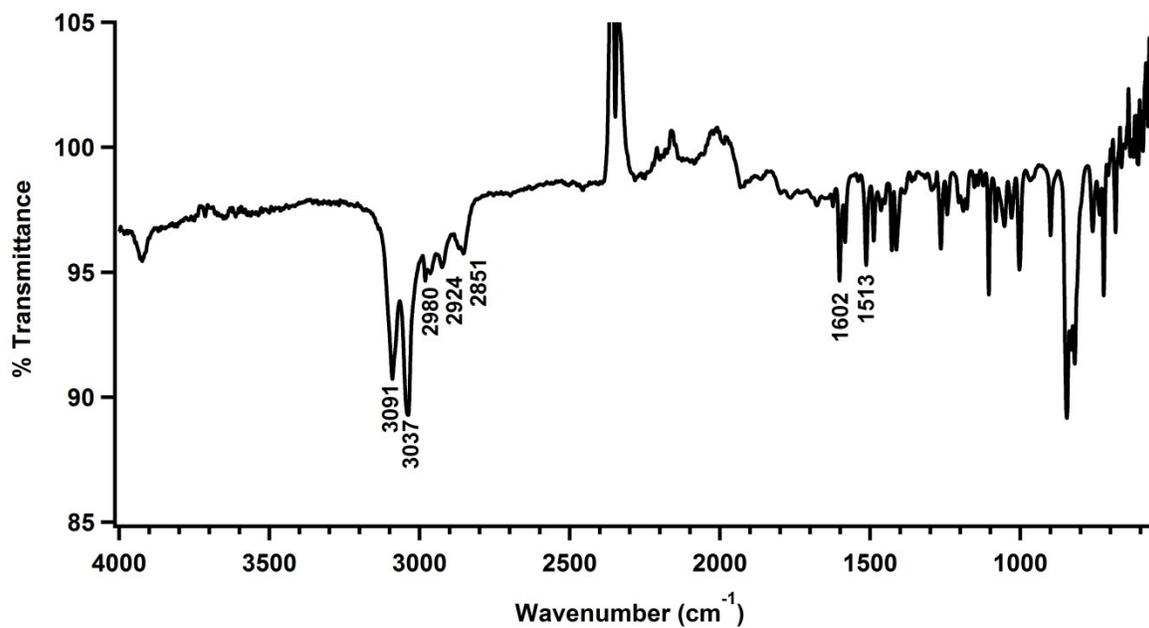

Figure S12. FTIR spectrum of 2.

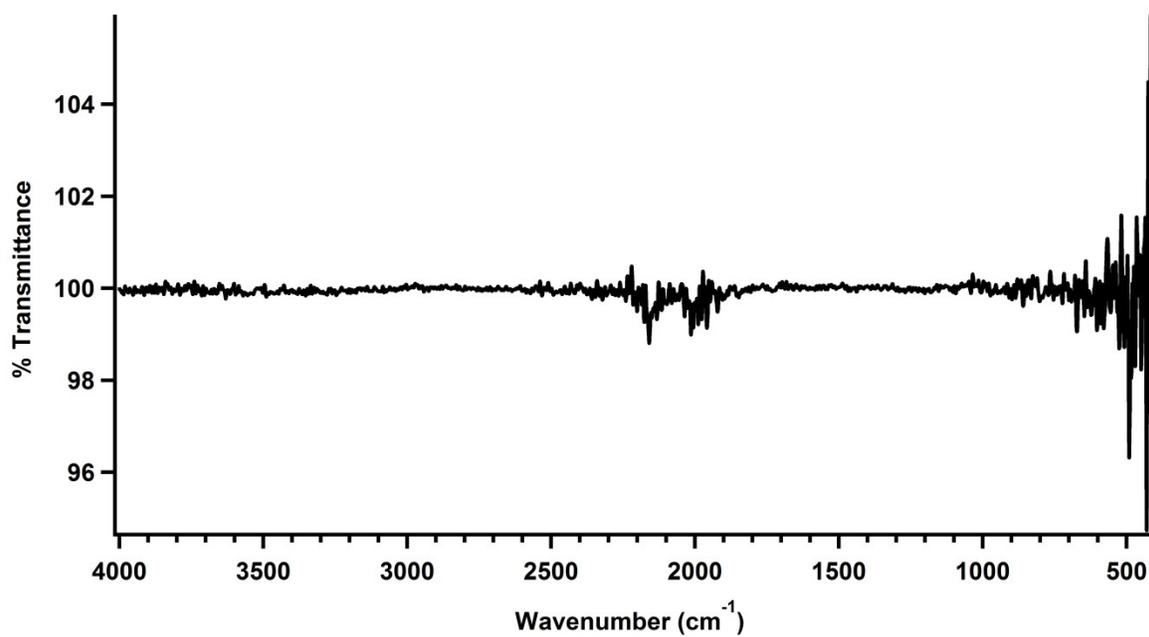

Figure S13. FTIR spectrum of a clean gold substrate using clean gold as a background.

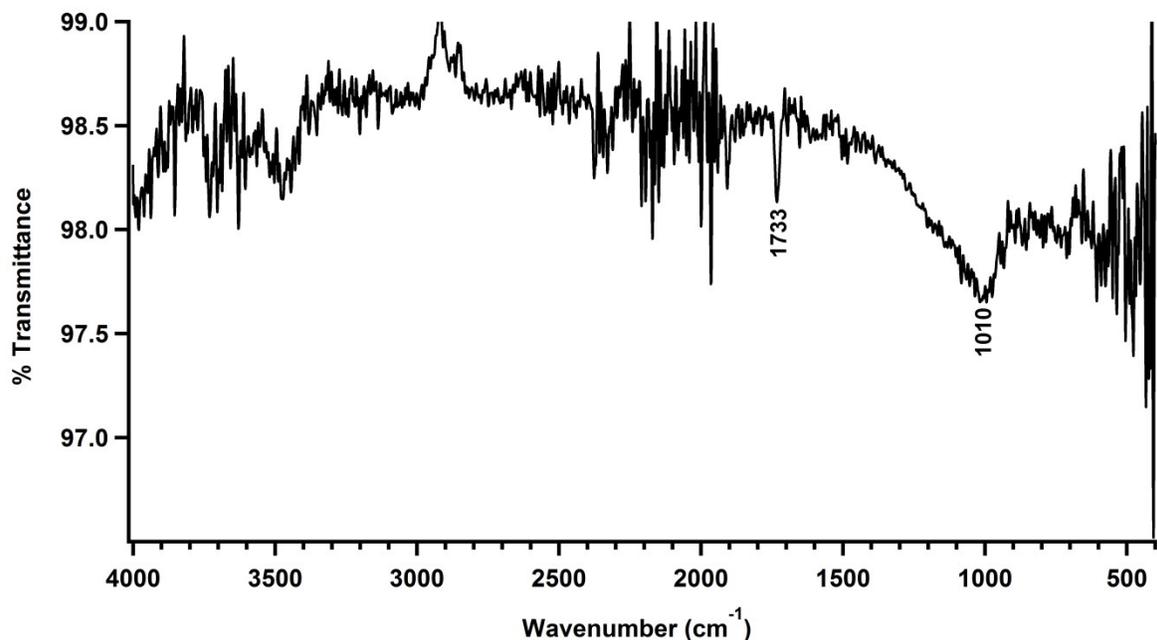

Figure S14. FTIR spectrum of a clean substrate after submersion in a 1 mM solution of **2** and rising with CH₃CN using clean gold as a background.

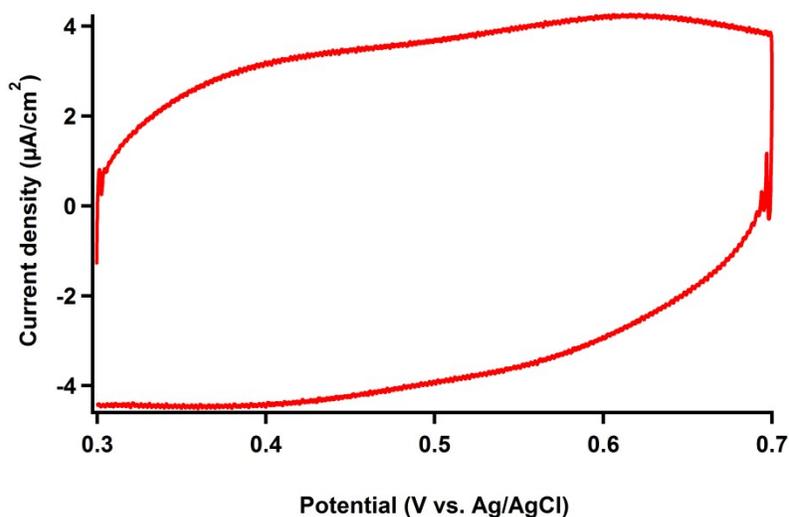

Figure S15. Cyclic voltammogram of a clean Au foil in an aqueous 0.1 M HClO₄ solution. Potentials measured versus a Ag/AgCl reference electrode in 1 M KCl. The 1 cm² Au substrate was used as the working electrode and glassy carbon as the auxiliary electrode.

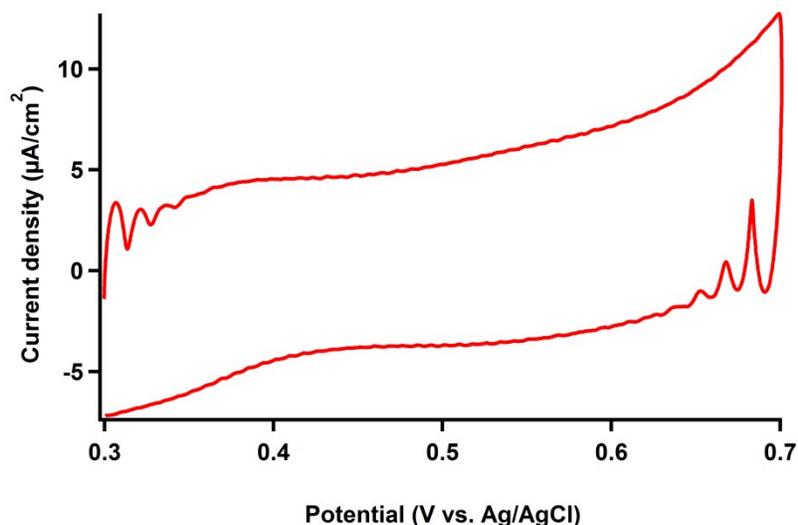

Figure S16. Cyclic voltammogram of a Au foil after pyrene-functionalization in an aqueous 0.1 M HClO₄ solution. Potentials measured versus a Ag/AgCl reference electrode in 1 M KCl. The 1 cm² Au substrate was used as the working electrode and glassy carbon as the auxiliary electrode.

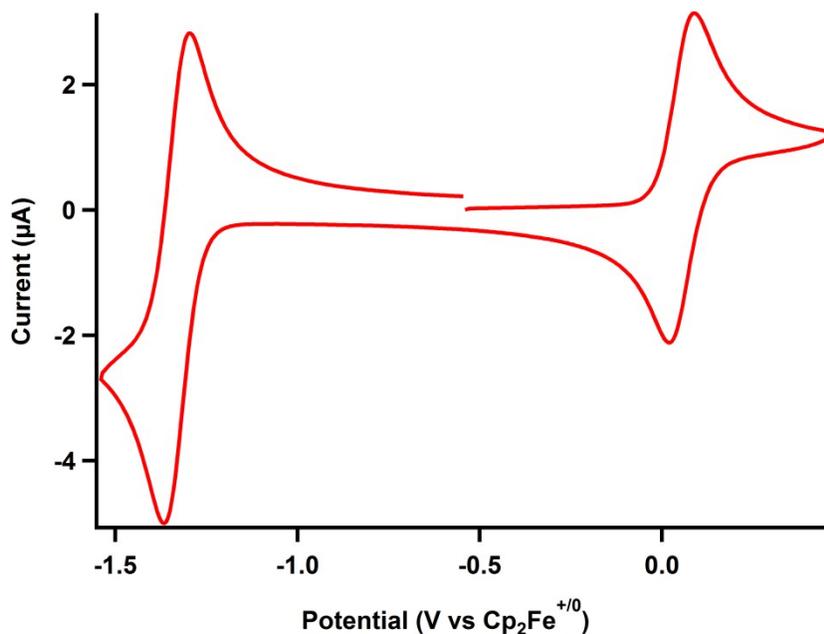

Figure S17. Cyclic voltammogram of 1-pyrenylferrocene (**2**) in CH₃CN. 100 mV/s scan rate. 1 mM analyte in 0.1 M [Bu₄N][PF₆] solution with internal cobaltocene reference. Potentials reported versus the cobaltocene/cobaltocenium redox couple shown at -1.38 V. Glassy carbon working and auxiliary electrodes; Ag/Ag⁺ pseudo-reference electrode. E_{1/2} = 1.38 V vs. Cp₂Co⁺⁰. [Cp₂Co][PF₆] was used as the internal standard because **2** has an indistinguishable couple to ferrocene when measured together.

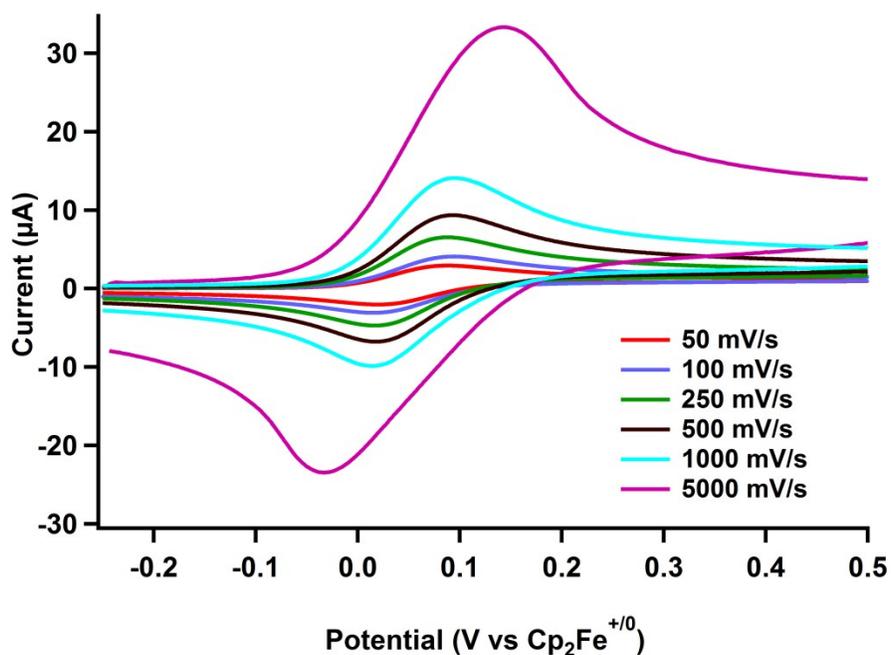

Figure S18. Variable scan rate cyclic voltammogram of 1-pyrenylferrocene (**2**) in CH₃CN ($E_{1/2} = 0.055$ V vs. Cp₂Fe⁺⁰). Scan rates varying from 50 – 5000 mV/s. 1 mM analyte in 0.1 M [Bu₄N][PF₆] solution with an internal cobaltocene reference. Glassy carbon working and auxiliary electrodes; Ag/Ag⁺ pseudo-reference electrode. Potentials were measured against the cobatocene/cobatocenium redox couple and then referenced to the ferrocene/ferrocenium redox couple (-1.33 V vs. Cp₂Fe⁺⁰) using previously reported values.¹

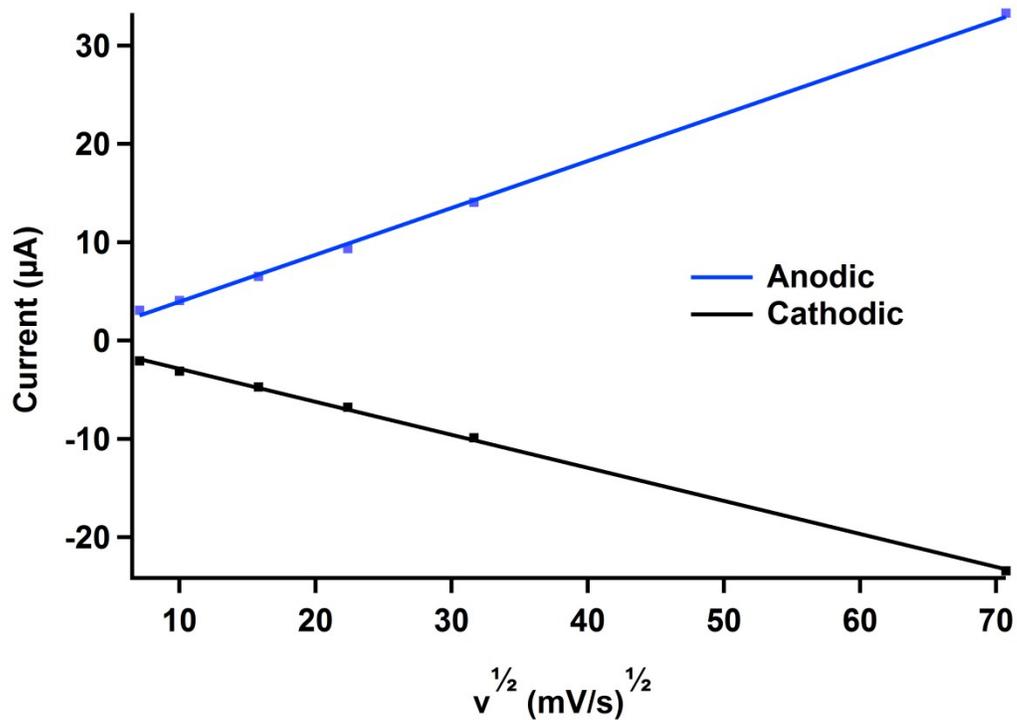

Figure S19. Plot of current vs. the square root of scan rate from cyclic voltammograms in Figure S18. The linear trend for both anodic and cathodic waves suggests diffusion control of the analyte, **2**, which is expected for a non-surface bound species.

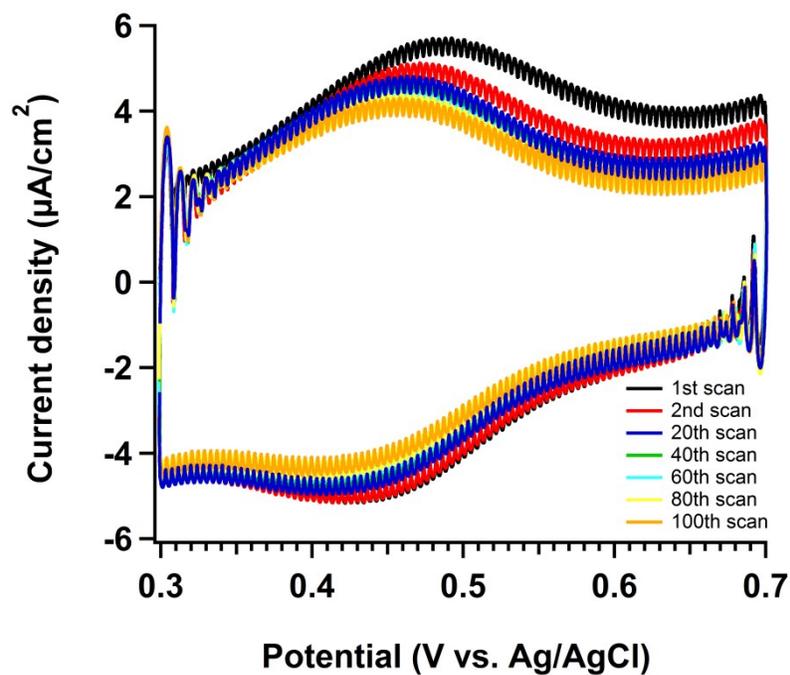

Figure S20. Cyclic voltammogram of a gold substrate functionalized with pyrene followed by exposure to **2**. 100 subsequent oxidation/reduction cycles were performed to probe redox stability of the pi-pi interactions fixing **2** to the surface. The voltammogram was recorded in an aqueous 0.1 M HClO_4 solution at 250 mV/s. Potentials were measured versus a Ag/AgCl reference electrode in 1 M KCl. The 1 cm^2 Au substrate was used as the working electrode and glassy carbon as the auxiliary electrode.

| Scan # | Γ_{O} (pmol/cm ²) | Γ_{R} (pmol/cm ²) |
|--------------------|---|---|
| 1 | 17.1 | 8.8 |
| 2 | 16.8 | 7.5 |
| 20 | 16.6 | 9.6 |
| 40 | 19.8 | 10.4 |
| 60 | 13.9 | 8.7 |
| 80 | 15 | 9.1 |
| 100 | 17.5 | 8.4 |
| Average | 16.7 | 8.9 |
| Standard deviation | 1.9 | 0.9 |

Table S1. Calculated surface concentrations (Γ) of **2** for oxidative (Γ_{O}) and reductive waves (Γ_{R}) for various scans from the voltammogram in Figure S20 assuming a 1 e⁻ oxidative or reductive process. Surface concentrations were calculated through integration of the faradaic current per cm², divided by scan rate and then divided by Faraday's constant.

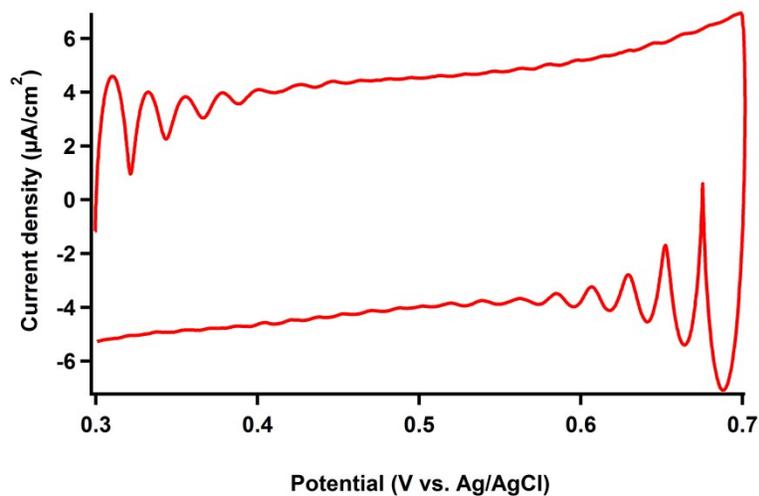

Figure S21. Cyclic voltammogram of a Au foil after soaking in a 1 mM CH₂Cl₂ solution of **2** and rinsing with CH₃CN. The pyrene-functionalized monolayer is not present on the sample. The voltammogram was recorded in an aqueous 0.1 M HClO₄ solution. Potentials measured versus a Ag/AgCl reference electrode in 1 M KCl. The 1 cm² Au substrate was used as the working electrode and glassy carbon as the auxiliary electrode.
