I. General procedures

Chromatography was performed on silica gel (Aldrich, 230 – 400 mesh). Thin-layer chromatography was performed on Merck silica gel 60 F254 plates. Compounds were visualized by UV and cerium/molybdenum or potassium permanganate staining. Progress and conversion of the reactions were determined by GC-MS. Mass spectra were recorded on an LTQ Orbitrap XL mass spectrometer. $^1$H-NMR and $^{13}$C-NMR were recorded on 400 and 100 MHz using CDCl$_3$ as solvent. Chemical shift values are reported in ppm with the solvent resonance as the internal standard (CHCl$_3$: δ 7.26 for $^1$H, δ 77.16 for $^{13}$C). Data are reported as follows: chemical shifts, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, br = broad, m = multiplet), coupling constants (Hz), and integration. Optical rotations were measured on a polarimeter with a 10 cm cell (c given in g/100 mL).

All reactions were carried out under a nitrogen atmosphere using oven-dried glassware and using standard Schlenk techniques. All reagents were purchased from commercial sources and used without further purification. Dichloromethane, tetrahydrofuran and toluene were used from a solvent purification system.

Compounds 1, 2a and 2b were synthesized according to literature procedures.1

Allylic ether 3a (0.581 mmol, 170.0 mg) was dissolved in a 4:1 mixture of acetonitrile/H2O (40 ml) and the solution was cooled to 0 °C. Ceric Ammonium Nitrate (2.03 mmol, 1.11 g) was slowly added in portions and the mixture was stirred for 10 min. The mixture was diluted with CH2Cl2 (40 ml) and washed with brine (25 ml) and water (25 ml). The organic phase was dried over anhydrous MgSO4, filtered and concentrated in vacuo to yield the resulting alcohol (165.9 mg) which was used without further purification.

The crude product (165.9 mg) was dissolved in H2O (2 ml) and AcOH (5 ml) and stirred 5 h. After co-evaporations with toluene (4 x 2 ml) the resulting triol (107.2 mg) was obtained which was used without further purification.

The crude product (107.2 mg) was dissolved in DMF (3 ml) and cooled to 0 °C. TBDPSCI (0.639 mmol, 175.6 mg), imidazole (0.872 mmol, 59.4 mg) and DMAP (0.0465 mmol, 5.7 mg) were added and the mixture was allowed to warm to rt after which it was stirred during 16 h. Then it
was poured into water (5 ml) and extracted with CH₂Cl₂ (3 x 5 ml). The combined organic layers were washed with water and brine and dried over anhydrous Na₂SO₄, filtered and concentrated in vacuo.

The resulting product was dissolved in 2,2-dimethoxypropane (6 ml) and PPTS (0.058 mmol, 14.58 mg) was added and the resulting mixture was stirred for 3 d under nitrogen atmosphere. H₂O (5 ml) and Et₂O (5 ml) were added and the mixture was washed with saturated aqueous NaHCO₃ solution (5 ml). The layers were separated and the aqueous layer was extracted with Et₂O (3 x 5 ml). The combined organic layers were washed with brine, dried over Na₂SO₄ and concentrated in vacuo.
