I. General Information

The starting materials were commercially available and all the reactions were carried out in dried glasswares with freshly distilled dry solvents under anhydrous conditions unless otherwise indicated. $^1$H NMR and $^{13}$C NMR spectra were recorded in CDCl$_3$ or DMSO-$d_6$ at 400 MHz or 500 MHz NMR spectrometer. The chemical shifts (d) were referenced to TMS. Melting points were measured with a micro melting point apparatus. TLC was performed using commercially prepared 100-400 mesh silica gel plates (GF$_254$), and visualization was effected at 254 nm. High resolution mass spectra (HRMS) were recorded on the Exactive Mass Spectrometer equipped with El or ESI ionization source. Agilent 1100 high performance liquid chromatography (HPLC) equipped with an analytical RP-18 column.

$^{[a]}$ One-pot one-step reaction conditions: 1a (1.0 mmol), 2a (1.2 mmol), CuCl (2.0 mol%), TMEDA ($N$, $N$, $N'$, $N'$-tetramethylethylenediamine) (1.5 mol%), Base (5 mmol), CO$_2$ (ambient pressure) from an aqueous capturing solvent (5 mL) at 25 °C for 16 h and then stirring continued at 100 °C for 10 h.

$^{[b]}$ Isolated yield (based on 1a).

$^{[c]}$ One-pot two-step reaction conditions: K$_3$PO$_4$ (1.2 mmol), CO$_2$ (ambient pressure) from an aqueous capturing solution, DMF (5 mL), room temperature (about 25 °C), schlenk tube 16 h. After extracting offered the crude product. Then KOAc (4 mmol) and the crude product were dissolved in anhydrous MeCN (5 mL) and stirred at 100 °C schlenk tube for 10 h under nitrogen atmosphere in the second step.

$^{[d]}$ CuCl (2.0 mol%) and TMEDA (1.5 mol%) were added in the second step.
(2) Determination of glyoxylic acid (6a) by HPLC

Standard sample (40% in water) was analyzed under the following conditions: delivery system, MeOH (A)−0.1% H₂O (aq) (B), 10% A/B to 45% A/B in 18 min, and 7 min to 95% A/B; amount injected, 1 mg/20 μL (MeOH) × 3; flow rate, 0.6 mL/min; monitored at 280 nm.

(3) Capture and release of arbon dioxide in air$^3$

The air was bubbled by pressure pump in 100 mL aqueous morpholine solution (0.4 mol/L) in a Schlenk flask at 25 °C. Stop keeping bubbling until a large number of white solid generated. The CO$_2$-saturated solution could be stored for more than a week at room temperature and used when needed. The flask with CO$_2$-saturated solution was linked to a reflux condenser. The top of reflux condenser and the target reaction flask was connected by a gas bottle equipped with concentrated sulfuric acid (98%). The CO$_2$-saturated solution was heated to 80 °C about 3 min to pushing the air out of the device through the vent line on the target reaction flask. Then the vent line was equipped with a balloon which was purged by pure CO$_2$. Keeping heating until no more CO$_2$ introduced from the aqueous morpholine solution (Figures 4 and 5).

![Chemical reaction diagram](image3)
1 (1.0 mmol), 2 (1.2 mmol), CuCl (2.0 mol%), TMEDA (1.5 mol%), K₃PO₄ (1.2 mmol) were dissolved in DMF (5 mL) and stirred in a Schlenk tube. The CO₂ from the captured solution was introduced to reaction tube for 3 min to pushing the air out of the device through the vent line on schlenk tube. Then the vent line was equipped with a balloon which was purged by pure CO₂. Keep heating until no more CO₂ introduced from the aqueous morpholine solution. The reaction mixture was stirred at room temperature (about 25 °C) for 16 h under an atmosphere of CO₂. After the Schlenk tube was cooled to room temperature, water was added into the mixture, and extracted with ethyl acetate three times. The combined organic layer was dried by anhydrous MgSO₄, and the solvent was removed under vacuum. The crude product was directly applied to second step reaction without further purified. In the second step reaction, the crude product and KOAc (4 mmol) were dissolved in anhydrous MeCN (5 mL) and stirred in a Schlenk tube at 100 °C for 10 h under a nitrogen atmosphere. Upon completion of the reaction as indicated by TLC, the mixture was filtered, washed with diethyl ether, and evaporated under vacuum. The residue was purified by flash column chromatography (hexane/ethyl acetate) to afford the pure product. Unfortunately, the alkynes with hydroxyl groups, such as 3-ethynylphenol and 3-methylpent-1-yn-3-ol, failed to afford the desired products but gave product 4w and 4x in high yields.
(5) Control experiments.

Synthesis of 2-Oxo-2-phenylethyl 3-phenylpropiolate (4a).

1a (1.0 mmol), 2a (1.2 mmol), CuCl (2.0 mol%), TMEDA (1.5 mol%), K$_3$PO$_4$ (1.2 mmol) were dissolved in DMF (5 mL) and stirred in a Schlenk tube. The CO$_2$ from the captured solution was introduced to reaction tube for 3 min to pushing the air out of the device through the vent line on schlenk tube. Then the vent line was equipped with a balloon which was purged by pure CO$_2$. Keep heating until no more CO$_2$ introduced from the aqueous morpholine solution. The reaction mixture was stirred at room temperature (about 25 °C) for 16 h under an atmosphere of CO$_2$. After the Schlenk tube was cooled to room temperature, water was added into the mixture, and extracted with ethyl acetate three times. Upon completion of the reaction as indicated by TLC, the mixture was filtered, washed with diethyl ether, and evaporated under vacuum. The residue was purified by flash column chromatography (hexane/ethyl acetate) to afford the pure product 3a (83%).

1a (2.0 mmol), 2v (2.4 mmol), CuCl (2.0 mol%), TMEDA (1.5 mol%), K$_3$PO$_4$ (2.4 mmol) were dissolved in DMF (10 mL) and stirred in a Schlenk tube. The CO$_2$ from the captured solution was
introduced to reaction tube for 3 min to pushing the air out of the device through the vent line on schlenk tube. Then the vent line was equipped with a balloon which was purged by pure CO$_2$. Keep heating until no more CO$_2$ introduced from the aqueous morpholine solution. The reaction mixture was stirred at room temperature (about 25 °C) for 16 h under an atmosphere of CO$_2$. After the Schlenk tube was cooled to room temperature, water was added into the mixture, and extracted with ethyl acetate three times. The combined organic layer was dried by anhydrous MgSO$_4$, and the solvent was removed under vacuum. The crude product was directly applied to second step reaction without further purified. In the second step reaction, the crude product and KOAc (8 mmol) were dissolved in anhydrous MeCN (10 mL) and stirred in a Schlenk tube at 100 °C for 6 h under a nitrogen atmosphere. Upon completion of the reaction as indicated by TLC, the mixture was filtered, washed with diethyl ether, and evaporated under vacuum. The residue was purified by flash column chromatography (hexane/ethyl acetate) to afford the pure products 3a (41%) and 5v (48%).

**Synthesis of 4,5-Diphenylfuran-2(5H)-one 3a from 5-acetyl-4,5-diphenylfuran-2(5H)-one (5v)**

5v (0.8 mmol) and KOAc (3.2 mmol) were dissolved in anhydrous MeCN (5 mL) and stirred in a Schlenk tube at 100 °C for 10 h under a nitrogen atmosphere. Upon completion of the reaction as indicated by TLC, the mixture was filtered, washed with diethyl ether, and evaporated under vacuum. The residue was purified by flash column chromatography (hexane/ethyl acetate) to afford the pure product 3a (81%).
