General remark

$^1$H NMR and $^{13}$C NMR spectra were recorded on 400MHz and 100MHz in CDCl$_3$ (BRUKER 400M or JNM-ECS 400M). All chemical shifts are given as δ value (ppm) with reference to tetramethylsilane (TMS) as an internal standard. All compounds were further characterized by HRMS; copies of their $^1$H NMR and $^{13}$C NMR spectra are provided. Products were purified by flash chromatography on 200–300 mesh silica gels. All melting points were determined without correction. Unless otherwise noted, commercially available reagents and solvents were used without further purification.

**General procedure for the synthesis of homopropargylic alcohols**$^{[1-2]}$:

![Chemical reaction](image)

1) Aldehyde (1.0 equiv.) was dissolved in anhydrous THF. A sample was taken out for analysis and propargyl bromide (2.0 equiv.) was added. Another sample was taken out for analysis and saturated aqueous NH$_4$Cl was added. Portions of activated zinc dust (2.0 equiv.) were added slowly on at 0°C and the resulting suspension was stirred overnight at this temperature. The THF layer was separated from the aqueous layer, which was extracted with diethyl ether for 3 times. The combined organic layers were washed with brine, dried over Na$_2$SO$_4$, filtered and concentrated in vacuo. The crude product was directly used in the next step without further purification; the residue was purified by column chromatography (silica gel, appropriate mixture of n-hexane/ethyl acetate) to obtain S$_1$.

![Chemical reaction](image)

2) To a dried schlenk flask was added Pd(PPh$_3$)$_2$Cl$_2$ (0.2 mmol), CuI (0.2 mmol), iodoarene (11.0 mmol), S$_1$ (10.0 mmol) and freshly distilled Et$_3$N under argon. The resulting mixture was stirred for 16 h at rt. 50 mL of EtOAc were added and the mixture filtered. After removal of solvent using rotary evaporator, the crude
compound was purified by SiO₂ chromatography to give 1a-1z, 1ac and 1ad.

1aa were prepared in the method[^3]

\[
\begin{align*}
\text{S}_1 & \xrightarrow{n-\text{BuLi}, \text{CH}_3\text{I}, \text{THF}, -78 ^\circ\text{C}-\text{rt.}} \text{1aa} \\
\end{align*}
\]

\textit{n-BuLi (2.5 M in hexanes, 6 mL, 15 mmol) was slowly added to a stirred solution of the propargyl alcohol (876 mg, 6 mmol) prepared in dry THF (20 mL) at -78 °C under Ar. After being stirred at -78 °C for 1 h, the reaction mixture was treated with CH₃I (1.12 mL, 18 mmol) and then allowed to warm to rt over night. The reaction mixture was then cooled to -78 °C again, quenched with sat NH₄Cl (aq) (10 mL) and extracted with Et₂O (3 * 20 mL). The combined organic phases were dried over Na₂SO₄, filtered and concentrated in vacuo. The residue was purified by column chromatography on silica gel to give 1aa as yellow oil.}

1ab were prepared in the method[^4]

\[
\begin{align*}
\text{S}_2 \xrightarrow{\text{MgBr, Et₂O, -30 ^\circ\text{C.}}} + \text{valeraldehyde} \xrightarrow{\text{Pd, Cu, Et₃N, \text{Et₂O}}} \text{1ab} \\
\end{align*}
\]

\textit{Under an argon atmosphere, magnesium turnings (0.67 g, 27.5 mmol) and mercury chloride (0.34 g, 1.3 mmol) were mixed in dry diethyl ether (40 mL) in a 250 mL round-bottom flask. To the solution, propargyl bromide (2.0 mL, 25 mmol) was then added dropwise at 60 °C over about 1 h. The reaction was kept at the same temperature until the yellow solution turned cloudy. This solution was cooled to -30 °C and a solution of valeraldehyde (6 mmol) in Et₂O (12 ml) was added dropwise. After addition the reaction was moved to room temperature for further 30 min then quenched with sat. NH₄Cl (aq). The aqueous layer was extracted with ether and the extracts were combined with the above organic layer. The combined solution was dried over Na₂SO₄. After evaporation of the solvent the residue was purified by column chromatography (silica gel, appropriate mixture of n-hexane/ethyl acetate) to afford S₂.}
To a dried schlenk flask was added \( \text{S}_2 \) (10.0 mmol), \( \text{Pd(PPh}_3\text{)}_2\text{Cl}_2 \) (0.2 mmol), CuI (0.4 mmol), iodoarene (11.0 mmol) and freshly distilled \( \text{Et}_3\text{N} \) (50 ml) under argon. The resulting mixture was stirred for 16 h at rt. The reaction mixture was quenched with sat. \( \text{NH}_4\text{Cl} \) (aq) and 50 mL of ethyl acetate were added and the mixture filtered. After removal of solvent using rotary evaporator, the crude compound was purified by column chromatography on silica gel to give 1ab.

**General procedure for synthesis of S-substituted furans from homopropargylic alcohols and DMSO:**

\[
\begin{align*}
\text{R}^2\text{OH} & \quad \text{DMSO} \\
\text{R}^3 \quad 1\text{a} & \\
\text{I}_2 (10 \text{ mol\%}) & \quad \text{TBHP (2.0 equiv.)} \\
\text{NH}_4\text{I (2.0 equiv.)} & \quad 150 \text{ }^\circ\text{C}
\end{align*}
\]

The homopropargylic alcohols (1a, 0.3 mmol), iodine (0.03 mmol), TBHP (0.6 mmol), \( \text{NH}_4\text{I} \) (0.6 mmol) were mixed in DMSO (2 mL) and this mixture was carried out under \( \text{N}_2 \) at 150 °C for 4 h. The reaction mixture was cooled to room temperature and then washed with saturated sodium thiosulfate (10 mL), extracted with ethyl acetate (15 ml × 3). The combined organic phase was dried over anhydrous \( \text{Na}_2\text{SO}_4 \). The solvent was evaporated in vacuo and the crude product was purified by column chromatography, eluting with petroleum ether/EtOAc (10:1) to afford the desired 3-(methylthio)-2,5-diphenylfuran 3a.
