General experimental procedures
All the reactions were carried out under argon atmosphere using standard Schlenk technique. $^1$H NMR (400 MHz) and $^{13}$C NMR (100 MHz) were recorded on a NMR spectrometer with CDCl$_3$ as solvent. Chemical shifts of $^1$H and $^{13}$C NMR spectra are reported in parts per million (ppm). The residual solvent signals were used as references and the chemical shifts converted to the TMS scale (CDCl$_3$: δ H = 7.26 ppm, δ C = 77.16 ppm). All coupling constants ($J$ values) were reported in Hertz (Hz). Column chromatography was performed on silica gel 200–300 mesh.

General Procedure for Synthesis of 1-(pyrimidin-2-yl) indoline derivatives (1) : To a solution of an indole (5.0 mmol, 1.0 equiv) in AcOH (25 mL) at 0°C was added NaBH$_3$CN (1.26 g, 20.0 mmol, 4 equiv) in portions. The reaction was allowed to stir at room temperature for 4 hours. 280 mL 50% NaOH saturated solution was then added slowly at 0°C and the reaction mixture was extracted with ethyl acetate three times. The combined organic layers were washed by water and sodium chloride saturated solution then were dried over MgSO$_4$ filtered. Then concentrated under reduced pressure. Indoline was purified through column chromatography on silica gel, and elution with petroleum ether/ ethyl acetate (20:1) gave the indoline in 85% yield.

The indoline and 2-chloropyrimidine (5 mmol, 1.2 equiv) was dissolved in a mixture of EtOH (50 mL). Concentrated hydrochloric acid (1 mL) was added to the mixture. Then, the resulting solution was refluxed overnight. EtOH was then removed under reduced pressure, and the aqueous phase was extracted twice with DCM. The combined organic layers were dried over MgSO$_4$, filtered, and evaporated under reduced pressure. The purification was performed by flash column chromatography on silica gel with petroleum ether/ ethyl acetate (5:1) gave the product in 70% yield.

General Procedure for Synthesis of anthranils (2a-2f, 2m): To a solution of 2-nitrobenzaldehyde (10.0 mmol, 1.0 equiv) in a 1:1 mixture of EtOAc - MeOH (50 mL) at 25°C was added SnCl$_2$·H$_2$O (30.0 mmol, 3.0 equiv). The reaction was allowed to stir at 25°C for 20h. The reaction was partitioned between EtOAc (50 mL) and NaHCO$_3$ (50 mL). The aqueous phase was extracted with EtOAc (3 × 20 mL) and the organic portions combined, washed with H$_2$O (20 mL), saturated aqueous NaCl (20 mL), dried over MgSO$_4$, filtered and reduced in vacuo. The residue was purified by flash column chromatography on silica gel with petroleum ether/ ethyl acetate (20:1) to provide the title compound.

General Procedure for Synthesis of anthranils (2h-2l) :

![Chemical structure of anthranils](image2)
To a solution of NaOH (4.0 g) in EtOH (40 mL) refluxed for 0.5h, then added nitrobenzene (11.0 mmol) when cooled to 40°C, the mixture was allowed stirred at 40°C for 0.5h. Then the solution was cooled to room temperature, added 2-phenylacetonitrile (10.0 mmol) slowly, the mixture was stirred at room temperature for 3h. The residue was purified by flash column chromatography on silica gel with petroleum ether/ethyl acetate (100:1) to provide the title compound.

Reactions of carbazole and N-acetyl indoline with anthranils:

Representative procedures for the synthesis of product 3:
Substitued 1-(pyrimidin-2-yl)indolines (0.2 mmol), [Cp*RhCl₂]₂ (0.006 mmol), AgSbF₆ (0.024 mmol), anthranils (0.5 mmol) and MesCOOH (0.4 mmol) was dissolved in THF (2 mL) in a pressure tube. The mixture was stirred at 90°C for 24 h under argon atmosphere. After that, the solvent was removed under vacuum and
the residue was purified by silica gel chromatography using petroleum ether/ethyl acetate to afford product 3.
