7. Copies of the $^1$H NMR, $^{13}$C NMR and $^{19}$F NMR spectra of products ..........11
1. General Information

Unless otherwise mentioned, solvents and reagents were purchased from commercial sources and used as received. $^1$H NMR spectra at 500 MHz, $^{13}$C NMR spectra at 125 MHz and $^{19}$F NMR spectra at 470 MHz were obtained on a Bruker-AV500 spectrometer. $^1$H NMR and $^{13}$C NMR were recorded using tetramethylsilane (TMS) in the solvent of CDCl$_3$ as the internal standard ($^1$H NMR: TMS at 0.00 ppm, CDCl$_3$ at 7.26 ppm; $^{13}$C NMR: CDCl$_3$ at 77.0 ppm). Data for $^1$H, $^{13}$C and $^{19}$F NMR were recorded as follows: chemical shift (δ, ppm), multiplicity (s = singlet, d = doublet, t = triplet, m = multiplet, q = quartet, br = broad). Infrared spectra were recorded on a Bruker TENSOR27 spectrometer using KBr pellets. The high-resolution mass spectrometry (MS) spectra were acquired in electrospray ionization (ESI) positive mode using a Bruker Maxis UHR-TOF mass spectrometer. Mass spectra using electron impact (EI) techniques were recorded on a Thermo ITQ700 spectrometer. Gas chromatograph were recorded on Shimadzu GC-2014C.

2. General method for the synthesis of 3,3,3-trifluoropropanal dialkyl acetals (3a-o)

A 150-mL autoclave was charged with 1 %mol of 5% Pd/C and 2 %mol of CuCl$_2$ in 20 mL of alcohol, and TFP gas (30 mmol) was introduced at -30°C. Then, the autoclave was filled with 1 MPa oxygen. The mixture was stirred magnetically at 120°C for 8h. After the reaction, the autoclave was cooled to -30°C and the pressure was carefully released from the autoclave, the reaction mixture was submitted to GC analysis. By further distillation, we obtained the desired product (3d-h). The resulting solution was concentrated under reduced pressure and purified by silica gel chromatography (eluent: acetate and petroleum) to give the desired product.(3a-c, 3i-o).
