1. General information

Unless otherwise noted, all reagents were purchased from commercial suppliers and used without purification. All solvents were dried by standard methods. Ni(COD)$_2$ and phosphine ligands are stored under nitrogen in the glove box. Unless otherwise noted, all coupling reactions were performed in 10-mL glass vessel tubes. Unless otherwise noted, all reactions were carried out under N$_2$ atmosphere.

Flash column chromatography was performed using 200-300 mesh silica gel. Visualization on TLC was achieved by the use of UV light (254 nm). All reactions were monitored by GC, GC-MS. $^1$H NMR and $^{13}$C NMR spectra were measured on a Bruker Avance III-400 spectrometer. ($^1$H 400 MHz, $^{13}$C 101 MHz), using CDCl$_3$ as the solvent with tetramethylsilane (TMS) as the internal standard. Chemical shifts are reported in ppm and referenced to residual solvent peaks (CHCl$_3$ in CDCl$_3$: 7.26 ppm for $^1$H and 77.0 ppm for $^{13}$C). The coupling constants J are given in Hz. Mass spectra were recorded by GCMS-QP2010 ultra spectrometer. The high-resolution mass spectrum (HRMS) was recorded on MAT 95 XP instrument. The GC yields were accorded to the authentic samples/tridecane calibration standard from Shimadzu GC-2010 plus equipped with FID system.
2. Preparation of substrates

Substrates 1a, 1n, 1o, 1p, 1q, 1r, 1s, 2t, 2u, and 2v were prepared according to the literature procedure. 1 Substrates 2h, 2i, 2j, 2k were prepared according to the reported literatures. 2 Substrates 2f was prepared via methylation of the corresponding sulfones. 3

Preparation of 1l

To a solution of indole-5-methanol (2.94 g, 20 mmol) and NaH (40 mmol) in DMF (40 mL) was added CH₃I (1.2 equiv) at room temperature. After stirring for 12h at 120 °C, the reaction mixture was quenched with saturated NaHCO₃ (10 mL), then the layers were separated. The aqueous layer was extracted with CH₂Cl₂ (25 mL × 3) and the combined organic layer was dried over Na₂SO₄ and then filtrated. After evaporation of the solvent under reduced pressure, the crude residue was purified by flash column chromatography to afford the methylated product (1-methyl-1H-indol-5-yl)methanol. To a solution of (1-methyl-1H-indol-5-yl)methanol and 4,4-dimethylaminopyridine (DMAP, 10 mol%) in CH₂Cl₂ (30 mL) was added triethylamine (1.2 equiv) at room temperature. Then pivaloyl chloride (1.2 equiv) was added dropwise over 3 min at 0 °C. After stirring for 15 min, the reaction mixture was quenched with saturated NaHCO₃ (10 mL), then the layers were separated. The aqueous layer was extracted with CH₂Cl₂ (25 mL × 3) and the combined organic layer was dried over Na₂SO₄ and then filtrated. After evaporation of the solvent under reduced pressure, the crude residue was purified by flash column chromatography (Petroleum ether/EtOAc = 10:1) to afford the product 1l.

Representative procedure

\]
To a solution of phenylmethanol (2.16 g, 20 mmol) and 4,4-dimethylaminopyridine (DMAP, 10 mol%) in CH$_2$Cl$_2$ (30 mL) was added triethylamine (3.35 mL, 24 mmol, 1.2 equiv) at room temperature. Then pivaloyl chloride (2.95 mL, 24 mmol, 1.2 equiv) was added dropwise over 3 min at 0 °C. After stirring for 15 min, the reaction mixture was quenched with saturated NaHCO$_3$ (10 mL), then the layers were separated. The aqueous layer was extracted with CH$_2$Cl$_2$ (25 mL × 3) and the combined organic layer was dried over Na$_2$SO$_4$ and then filtrated. After evaporation of the solvent under reduced pressure, the crude residue was purified by flash column chromatography (Petroleum ether/EtOAc = 10:1) to afford the product 1a in 90% yield.

3. General procedure and spectral data for the products

A. Typical procedure of Ni-catalyzed cross coupling of benzylic pivalate with methyl phenyl sulfone

In a nitrogen-filled glove box, a 10 mL sealed schlenk tube equipped with a magnetic stir bar was charged with 1a (0.2 mmol), Ni(COD)$_2$ (0.02 mmol), t-BuONa (0.4 mmol) and (methylsulfonyl)benzene (0.4 mmol) and toluene (0.5 mL). The reaction mixture was stirred at 100 °C for 0.5 hours. After cooling the reaction mixture to room temperature, the mixture was passed through a short silica gel column with EtOAc. The filtrate was concentrated and the residue was further purified by column chromatography on silica gel to give the product 3a in 71% yield.
