High-performance all-solid-state flexible carbon/TiO$_2$

micro-supercapacitors with photo-rechargeable capability

**Fig. S1** Schematic illustration of the laser direct writing system and a sample cell with a quartz window for Ar atmosphere.

**Fig. S2** TEM image (a) and XRD pattern (b) of the commercial TiO$_2$ nanoparticles. Although there are aggregations of the TiO$_2$ nanoparticles seen from the TEM image due to the water evaporation, it is still clear to distinguish the primary nanoparticles with a size of less than 10nm. The XRD pattern demonstrated the anatase phase of the TiO$_2$ nanoparticles.
Fig. S3 Top view (a) and cross-sectional SEM images and TEM image of the carbon structures obtained by laser direct writing on polyimide film in Ar at a typical laser power of 157 mW.

Fig. S4 The current curve of the electrophoretic deposition process.
Fig. S5 As-prepared interdigitated carbon/TiO$_2$ photo-rechargeable micro-supercapacitors.
