Materials and methods

General methods $^1$H and $^{13}$C NMR spectra were recorded using CDCl$_3$ and DMSO-d$_6$ as solvents. Chemical shifts were reported in δ units (ppm) with reference to TMS as an internal standard, and J values are given in Hz. $^1$H and $^{13}$C-NMR spectra were recorded on a Bruker AMX-400 MHz spectrometer. Mass determination of the materials was carried out using an LCQ Fleet Ion Trap (Thermo Scientific). Flash column chromatography was carried out with silica gel (220–440 mesh). The reactions were carried out in oven-dried glassware under nitrogen. Chemicals and compounds 1, 6, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24 were purchased from Aldrich, Fluka and Alfa Aesar. Commercial reagents were used without further purification. Analytical thin-layer chromatography (TLC) was performed on pre-coated plates (0.25 mm, silica gel 60 F254). Compound spots were visualized by UV light (254 nm).

Cyclic voltammetry (CV)

A WaveNow USB potentiostat Galvanostat (Pine Research Instrumentation) was utilized, using Pine After-Math Data Organizer software. A three electrode system was used, consisting of a mini glassy carbon electrode (diameter of the active zone: 2.8 mm; Metrohm) working electrode, a platinum wire counter electrode, and an Ag/AgCl reference electrode. The CV measurements in organic solvent were performed in acetonitrile solutions which contained 0.1 M in tetrabutylammonium perchlorate (TBAP, Fluka, recrystallized twice from methanol) and 0.4 mM substrate under N$_2$ atmosphere at ambient temperature. The E$_{1/2}$ value for the Ferrocene/Ferrocenium couple under these conditions was 0.47 V. The CV measurements in aqua solutions were performed in Tris buffer, pH 7.5 which contained 10% DMSO (for solubilizing the substrates) and 0.4 mM substrate under N$_2$ and O$_2$ atmosphere at ambient temperature. Scan rates of 10–1000 mV/s were applied.

Cell culture: 
DU-145 cells were grown in EMEM medium supplemented with 10% fetal bovine serum, 100 units/ml penicillin and 100 mg/ml streptomycin in 37 °C humidified incubator with a 5% CO₂, 95% air atmosphere.

Apoptosis studies: 
Induction of apoptosis in DU-145 cell line by treatment with 7, 9, 12 and 18 were determined after 2 h incubation in a dose dependent manner, using annexin V-FITC apoptosis detection kit
(BD Biosciences) according to the manufacturer’s protocol and monitored via flow-cytometry (fluorescence-activated cell sorting, FACS). Briefly, 2 x 10^5 cells/well were seeded in 6-well plates and treated with inhibitor for 2 hr in a dose dependent manner. The cells were then harvested and washed with PBS. Next, the cells were re-suspended with 85 µL binding buffer and stained with 10 µL annexin V-FITC reagent and 5 µL propidium iodide (PI) for 15 min in the dark. The increase in fluorescence, which indicates the apoptosis level in the treated cells, were monitored using flow cytometry and compared to untreated cells containing DMSO as a control.
