1. General Information

All operations were performed under an argon atmosphere. $^1$H, $^{13}$C, $^{31}$P NMR spectra were recorded on JEOL ECX-500 (500MHz for $^1$H, 125 MHz for $^{13}$C, and 200 MHz for $^{31}$P) or Bruker DRX-500 (125 MHz for $^{13}$C) using C$_6$D$_6$ ($^1$H, δ = 7.15; $^{13}$C, δ = 128.0) and H$_3$PO$_4$ ($^{31}$P, δ = 0.0) as internal standards. Mass spectra were recorded on a JEOL JMS-700. Elemental analyses were performed on an elementar vario MICRO. GC chromatograms were recorded on a SHIMADSU GC-2010 equipped with DB-1 column (for detection of methane, toluene) or DB-WAXETR column (for detection of acetic acid). Wakogel B-5F coated on glass in a thickness of 0.9 mm was used for preparative TLC. All the NMR experiments were carried out using NMR tube with Young’s Teflon bulb equipment. Benzene-$d_6$ and toluene-$d_8$ were dried and deoxygenated by treatment with sodium and benzophenone, followed by distillation under nitrogen atmosphere. The distillates were stored over molecular sieves 4A pellets in the glovebox. All the other liquid materials were distilled, degassed by argon bubbling, and stored in the glovebox.

Dehydrated dimethylacetamide (DMA), 1,2-bis(dicyclohexylphosphino)ethane (dcype), toluene-$d_8$ were purchased from Sigma-Aldrich co., LLC. Tetramethylurea (TMU) was purchased from Tokyo Chemical Industry co. LTD. Benzene was purchased from Wako Chemical Pure Industries, LTD. Benzene-$d_6$ was purchased from Kanto Chemical, co. INC.

$[\text{RhCl(coe)}]_2$ [RhCl(cod)]$_2$ and [Rh(OAc)(cod)]$_2$ were prepared by the known procedure.$^i$

AlMe$_{1.5}$(OEt)$_{1.5}$ and [Rh(dcype)]$_2$ were prepared as we previously reported.$^i$

\[
\begin{array}{c}
\text{5 x 10}^{-3} \text{mmol [RhCl(dcype)]}_2 \\
1.1 \text{mmol AlMe}_{1.5} \text{(OEt)}_{1.5} \\
1 \text{ atm CO}_2 \\
\text{DMA (0.1 mL), TMU (6 µL)} \\
85 \degree \text{C}, 6 \text{ h, closed} \\
\end{array}
\]

A solution of [RhCl(dcype)]$_2$ (5.6 mg, 0.005 mmol), DMA (0.1 mL), TMU (6 µL, 0.05 mmol) and AlMe$_{1.5}$(OEt)$_{1.5}$ (132 mg, 1.1 mmol) in benzene (2 mL) was stirred in a glass tube (φ = 2.0 cm, 18 cm) at room temperature for a few minutes, and then the system was purged with an atmospheric pressure of CO$_2$. The mixture was heated at 85 °C (outer temperature) for 6 h in the closed system. 2N HCl aq. and diethyl ether were added and the mixture was vigorously stirred for a few minutes. The mixture was filtered through a short plug of cotton, and the filtrate was extracted with diethyl ether three times. The combined organic layer was extracted with NaOH aq. three times.
and the combined aqueous layer was acidified with HCl aq., then extracted with diethyl ether three times, and the extract was dried over MgSO₄. After removal of solvent under reduced pressure, the residue was purified by silica-gel column chromatography (CH₂Cl₂ : AcOEt = 9 : 1) to give benzoic acid as a white solid (44.5 mg, 0.37 mmol).

In several experiments, the methods shown below were employed instead to quantify acetic acid or toluene.

**Acetic acid (Scheme 9)**: 1N HCl (2 mL) and diethyl ether (4 mL) were added to the reaction mixture after heating under CO₂ and the mixture was stirred for 30 minutes at room temperature. Dodecane (internal standard) was added to the resulting mixture, which was diluted with methanol until it became homogeneous, and was analyzed by GC to quantify acetic acid.

**Toluene (ref. 17)**: The extract was analyzed by GC before concentration to quantify toluene, using dodecane as an internal standard.

### 3. Preparation of Rhodium Complexes

#### Synthesis of RhMe(PCy₃)(dcype) 2 (Scheme 3)

![Scheme 3](image)

To a 100 mL two-necked flask were added [RhCl(dctype)]₂ (561 mg, 1.0 mmol), tricyclohexylphosphine (280 mg, 1.0 mmol) and THF (25 mL). After the mixture was cooled to −78 °C, MeLi (1.1 M in diethyl ether, 1.1 mmol, 1.0 mL) was added dropwise to the mixture, which was stirred overnight at room temperature. In the glovebox, the precipitate was collected by filtration, washed with THF, and was dried in vacuo to give RhMe(PCy₃)(dcype) 2 as a yellow powder (482 mg, 0.57 mmol, 57 %).

**¹H-NMR** (500 MHz, C₆D₆) δ 2.51–2.59 (br, 2H), 2.34–2.46 (br, 5H), 2.13–2.28 (br, 8H), 1.60–1.92 (m, 32H), 1.13–1.57 (m, 34H), 0.35–0.43 (m, 3H); **¹³C-NMR** (125 MHz, C₆D₆) δ 39.5 (d, J = 9.4 Hz), 36.1 (d, J = 19.1 Hz), 32.0 (d, J = 7.5 Hz), 31.2, 31.0, 29.9 (d, 14.5 Hz), 28.8 (d, J = 7.1 Hz) 28.3–27.7 (m), 27.5, 27.2 (d, J = 3.0 Hz), 25.5–25.1 (m), 23.3–22.9 (m), -7.5–-8.5 (m), two peaks overlap; **¹⁰¹P-NMR** (200 MHz, C₆D₆) δ 76.4 (ddd, J_{Rh-P} = 159 Hz, J_{P-P} = 321, 22 Hz), 67.0 (ddd, J_{Rh-P} = 124 Hz, J_{P-P} = 22, 22 Hz), 33.4 (ddd, J_{Rh-P} = 138 Hz, J_{P-P} = 321, 22 Hz), Anal. Calcd for C₄₅H₇₄P₂Rh: C, 65.84; H, 10.32; Found: C, 65.82; H, 9.85.
Synthesis of RhPh(PCy₃)(dcype) 3 (Scheme 3)

In a glovebox, to a 100 mL two-necked flask were added [RhCl(dcype)]₂ 1 (449 mg, 0.80 mmol), tricyclohexylphosphine (224 mg, 0.80 mmol) and THF (30 mL) and the mixture was cooled to –35 °C. A THF (5 mL) solution of PhLi (74 mg, 0.88 mmol) was added dropwise to the mixture, which was stirred for 1 h, and then the mixture was concentrated in vacuo. Toluene was added to the residue to separate LiCl as a precipitate, and the mixture was filtered through Celite. After concentration of the filtrate, the residue was suspended in ca. 10 mL of THF to dissolve impurities. The mixture was stirred for a few minutes, and then stored overnight in a refrigerator. The precipitated solid was collected by filtration and dried in vacuo to give RhPh(PCy₃)(dcype) 3 as a yellow powder (313 mg, 0.35 mmol, 44 %). A single crystal suitable for X-ray analysis was prepared from THF/DMA (Figure S1).

¹H-NMR (500 MHz, C₆D₆) δ 7.97 (m, 2H), 7.18 (t, J = 7.1 Hz, 2H), 7.02 (t, J = 7.1 Hz, 1H), 2.48–2.66 (br, 2H), 2.24–2.42 (br, 2H); 1.97–2.17 (m, 8H), 1.52–1.97 (m, 35H), 1.00–1.52 (m, 34H), 0.74–0.94 (m, 2H); ¹³C-NMR (125 MHz, C₆D₆) δ 174.9–173.8 (m), 142.2, 125.3, 120.1, 38.7 (d, J = 9.5 Hz), 38.1 (br), 36.6 (d, J = 20 Hz), 32.1 (d, J = 7.2 Hz) 31.7 (d, J = 11.9 Hz), 31.1, 29.8 (d, J = 15.5 Hz), 29.1, 28.7–27.8 (m), 27.3, 27.1, 26.9, 24.6–23.9 (m), one peak overlaps; ³¹P-NMR (200 MHz, C₆D₆) δ 65.7 (ddd, J_{Rh,P} = 162 Hz, J_{P,P} = 296, 22 Hz), 65.3 (ddd, J_{Rh,P} = 113 Hz, J_{P,P} = 22, 22 Hz), 26.3 (ddd, J_{Rh,P} = 145 Hz, J_{P,P} = 296, 22 Hz); Anal. Calcd for C₅₀H₈₆P₃Rh: C, 67.96; H, 9.86; Found: C, 68.42; H, 9.51.
**Figure S1.** The crystal structure of 3.

**Preparation of Rh(\text{O}_2\text{CPh})(\text{dcype}) \text{ D}**

\[
\text{[RhCl(cod)]}_2 \quad \text{5 equiv. PhCO}_2\text{K} \quad \text{acetone} \quad \text{reflux, 4 h} \quad \text{ca. 82 %} \quad \text{[Rh(\text{O}_2\text{CPh})(\text{cod})]_2} \quad \text{2 equiv. dcype} \quad \text{THF, rt, overnight} \quad \text{41 % (recrystd.)} \quad \text{D}
\]

**• Synthesis of [Rh(\text{O}_2\text{CPh})(\text{cod})]_2**

To a 100 mL round-bottom flask were added powdered KOH (>85 % purity, 313 mg, > 4.9 mmol), EtOH (10 mL) and benzoic acid (610 mg, 5.0 mmol), and the mixture was stirred for several minutes. After the solvent was removed in vacuo, [RhCl(cod)]_2 (493 mg, 1.0 mmol) and acetone (15 mL) were added. A Dimroth condenser and a balloon were attached to the vessel, which was purged with nitrogen. The mixture was refluxed for 4 h to give an orange suspension, which was dissolved with CH\text{2}Cl\text{2}, and then filtered through Celite. The filtrate was concentrated, washed with acetone and water to give [Rh(\text{O}_2\text{CPh})(\text{cod})]_2 in 82 % yield (548 mg, 0.83 mmol) as an orange powder. This material was used in the next step without further purification.
\( ^1 \text{H} \) NMR (500 MHz, \( \text{C}_6\text{D}_6 \)) \( \delta \) 8.03 (dd, \( J = 8.4, 1.4 \) Hz, 2H), 7.03-6.95 (m, 3H), 4.56-4.16 (broad, 4H), 2.86-2.28 (broad, 4H), 1.74-1.50 (broad, 4H).

**Observation of Rh(O\(_2\)CPh)(PCy\(_3\))(dcype) D\(^*\)**

In a glovebox, to an NMR tube was added Rh(O\(_2\)CPh)(dcype) D (3.2 mg, 0.005 mmol), PCy\(_3\) (14.0 mg, 0.05 mmol) and benzene (0.5 mL) at room temperature and the mixture was stood for 1.5 h.

Formation of a new complex assignable as Rh(O\(_2\)CPh)(PCy\(_3\))(dcype) D\(^*\) was observed by \(^{31} \text{P} \) NMR. 

\(^{31} \text{P} \)-NMR (200 MHz, \( \text{C}_6\text{D}_6 \)) \( \delta \) 84.7 (ddd, \( J_{\text{Rh-P}} = 183 \) Hz, \( J_{\text{P-P}} = 30 \) Hz, \( J_{\text{Rh-P}} = 152 \) Hz, \( J_{\text{P-P}} = 304 \) Hz), 28.0 (ddd, \( J_{\text{Rh-P}} = 127 \) Hz, \( J_{\text{P-P}} = 304 \) Hz).
**Figure S2.** $^{31}$P NMR spectrum of Rh(O$_2$CPh)(PCy$_3$)(dcype) D$^\ast$.

**Synthesis of Rh(OAc)(dcype) E**

In a glovebox, a solution of 1,2-bis(dicyclohexylphosphino)ethane (1.69 g, 4.0 mmol) in THF (25 mL) was added dropwise to a solution of [Rh(OAc)(cod)]$_2$ (1.08 g, 2.0 mmol) in THF (25 mL) and the mixture was refluxed for 5 h. The mixture was concentrated *in vacuo* and the residue was recrystallized from THF/pentane in a refrigerator to give E in 56 % yield (1.31 g, 2.24 mmol) as a yellow powder.iii $^1$H-NMR (500 MHz, C$_6$D$_6$) $\delta$ 2.34 (d, $J = 11.0$ Hz, 4H), 1.85-1.93 (s, 3H), 1.50-1.85 (m, 28H), 1.11-1.24 (m, 12H), 1.00 (d, 4H, $J = 10.5$ Hz, 4H); $^{13}$C-NMR (125 MHz, C$_6$D$_6$) $\delta$ 189.8, 36.9 (t, $J =11.9$ Hz), 29.8 (d, $J = 32.2$ Hz), 27.4–27.6 (m), 26.6, 24.9, 21.9 (td, $J = 21.5$, 4.8 Hz); $^{31}$P-NMR (200 MHz, C$_6$D$_6$) $\delta$ 103.4 (d, $J = 194$ Hz); HR-MS (FAB$^-$): Calcd for C$_{28}$H$_{51}$O$_3$P$_2$Rh [M]$^-$: 584.2419; Found: 584.2438.
**Observation of Rh(OAc)(PCy$_3$)(dcype) E’**

In a glovebox, to an NMR tube was added Rh(OAc)(dcype) E (5.8 mg, 0.01 mmol), PCy$_3$ (14.0 mg, 0.05 mmol) and benzene (0.5 mL) at room temperature and the mixture was stood for 1.5 h.

Formation of a new compound assignable as Rh(OAc)(PCy$_3$)(dcype) E’ was observed by $^{31}$P NMR. $^{31}$P-NMR (200 MHz, C$_6$D$_6$) δ 84.4 (ddd, $J_{Rh-P}$ = 183 Hz, $J_{P-P}$ = 31, 31 Hz), 77.9 (ddd, $J_{Rh-P}$ = 150 Hz, $J_{P-P}$ = 308, 31 Hz), 28.3 (ddd, $J_{Rh-P}$ = 127 Hz, $J_{P-P}$ = 308, 31 Hz).

**Figure S3.** $^{31}$P NMR spectrum of Rh(OAc)(PCy$_3$)(dcype) E’.
In a glovebox, RhMe(PCy₃)(dcype) 2 (4.1 mg, 0.005 mmol) was suspended in benzene (0.5 mL). The mixture was transferred to an NMR tube with a sealed thin glass tube, which contained a benzene solution of PPh₃ as an internal standard. The mixture was heated at 85 ºC for a few seconds to dissolve 2 completely, and then the mixture was monitored by ³¹P NMR. After heating at 85 ºC for 30 minutes, the peaks of 2 disappeared and phenylrhodium 3 was observed instead. Then, the NMR tube was purged with CO₂ and heated at 85 ºC for further 30 minutes. The formation of D and D’ was confirmed by ³¹P NMR. ³¹P NMR spectra of observed 3, D and D’ were consistent with those of authentic samples prepared by the methods described above.

Figure S4. ³¹P NMR spectra of the reaction of 2.
In a glovebox, a solution of PCy₃ in benzene was prepared by using volumetric flask. To an NMR tube were added 0.50 mL of this solution, RhMe(PCy₃)(dcype) 2 (4.1 mg, 0.005 mmol), and a sealed thin glass tube which contained a solution of 1,3,5-trimethoxybenzene (internal standard) in benzene (Figure S3). The mixture was heated to 75 °C for a few seconds to dissolve 2 completely. Then, the reaction of 2 and benzene was monitored by ¹H NMR at 75 °C. The spectra were recorded in every 5 minutes using noD–NMR. Consumption of 2 was monitored by comparing the intensity of the peaks of Rh–Me moiety (δ 0.3 ppm) with that of O–Me moiety of 1,3,5-trimethoxybenzene (δ 3.3 ppm). The gradual formation of methane (δ 0.13 ppm) was also detected along with the reaction (it could not be quantified due to its diffusion to the gas phase). Reactions were carried out using 0.025, 0.036, 0.050 and 0.10 M PCy₃ solutions in benzene. The reaction was first order to [2] and inverse first order to [PCy₃]. The linear correlation between −ln([2]/[2]₀) and the reaction time was maintained even after > 90 % consumption of 2 in the presence of 0.025 M PCy₃. Formation of RhPh(PCy₃)(dcype) 3 was ensured by ³¹P NMR after the reaction. The rate equations and the rate constant are given in eq. S1.

\[
-\ln \left( \frac{[2]}{[2]_0} \right) = k_H [PCy_3]^{-1} t, \quad k_{obs} = k_H [PCy_3]^{-1}
\]

\[
k_H = 6.9 \times 10^{-4} \text{ [M} \cdot \text{min}^{-1}] \text{ at 75 °C}
\]
The detailed results were summarized in Figure S6. The representative $^1$H NMR spectra during the measurement and the $^{31}$P NMR spectrum after the measurement were provided in Figure S7 and S8.

**Figure S6.** Kinetic study of C-H bond activation in benzene-$d_0$.

![Figure S6. Kinetic study of C-H bond activation in benzene-$d_0$.](image)

**Figure S7.** Kinetic study of C-H bond activation in benzene-$d_0$ by $^1$H NMR. [PCy$_3$] = 0.050 M. The spectra are those recorded in every 20 minutes.

![Figure S7. Kinetic study of C-H bond activation in benzene-$d_0$ by $^1$H NMR.](image)
**Figure S8.** $^{31}$P NMR spectrum after the kinetic study of C-H bond activation in benzene-$d_6$ (1.25 h, $[\text{PCy}_3] = 0.050$ M).

The same experiment was also carried out using benzene-$d_6$ instead of benzene (Figure 9). In this case, conventional $^1$H NMR was used and the spectra were recorded in every 20 minutes. Methane-$d_1$ ($\delta$ 0.13 ppm, $t$, $J = 1.8$ Hz) was observed instead of methane. The reaction was first order to [2] and inverse first order to [PCy$_3$]. The rate equations and the rate constant are given in eq. S2.

$$-\ln \left( \frac{[2]}{[2]_0} \right) = k_D[\text{PCy}_3]^{-1}t, \quad k_{obs} = k_D[\text{PCy}_3]^{-1} \quad (S2)$$

$$k_D = 1.0 \times 10^{-4} \text{ [M} \cdot \text{min}^{-1}] \text{ at 75 }^\circ\text{C}$$

The detailed results were summarized in Figure S9. The representative $^1$H NMR spectra during the measurement were provided in Figure S10.
Figure S9. Kinetic study of C-H bond activation in benzene-$d_6$.

Figure S10. Kinetic study of C-H bond activation in benzene-$d_6$ by $^1$H NMR. [PCy$_3$] = 0.0025 M. The shown spectra are those recorded in every 40 minutes. CH$_3$D was identified separately with higher resolution.
6. Observation of Methane under Catalytic Conditions Using GC/FID (Figure 2)

After the catalytic carboxylation of benzene was carried out under the standard conditions, a part of the gas phase of the vessel was pulled out by a syringe and it was plunged into GC (Shimadzu 2010 A series, detailed conditions are described above) Its GC chromatogram indicated the presence of methane (Figure S11, blue). It was further confirmed by checking the GC chromatogram of the mixture of the gas phase and standard methane (black). The formation of ethane was ruled out by the similar procedure (brown). Almost no formation of methane was observed when the reaction was carried out in the absence of Rh catalyst (red).

**Figure S11.** The GC chromatograms of the gas phase after the reaction.
7. Procedure for The KIE Experiment under Catalytic Conditions (Scheme 6)

The KIE of the reaction between benzene-$d_0$ and benzene-$d_6$ was estimated by $^1$H-NMR after esterification with benzyl bromide according to the known procedure. A mixture of benzoic acid $6-d_0$ and benzoic acid-$d_5$ $6-d_5$ was prepared according to the general procedure, except that the reaction time was 1 h and a mixed solution of each substrate (1 mL : 1 mL) was used.

To a 10 mL bial, a crude mixture of benzoic acid $6-d_0$ and benzoic acid-$d_5$ $6-d_5$ (which contained total of ca. 0.1 mmol of products based on weight), DMF (1 mL), $K_2CO_3$ (21 mg, 0.15 mmol) and NaI (6 mg, 0.04 mmol) were added at room temperature. After a few minutes, benzyl bromide (18 $\mu$L, 0.15 mmol) was added and the mixture was stirred for 18 h. The reaction mixture was diluted with diethyl ether, and then quenched with aqueous NH$_4$Cl. The organic layer was washed with water three times, dried over MgSO$_4$, and concentrated in vacuo. The crude mixture was purified by preparative TLC (hexane : ethyl acetate = 19 : 1) to give a mixture of benzyl benzoate-$d_0$ and benzyl benzoate-$d_5$-$d_5$. KIE ($[5-d_0]/[5-d_5]$) was calculated to be 5.5 on average of two sets of reactions by comparing integration of benzylic 2H (5.36 ppm) and 2H at ortho-positions of carboxy group (8.08 ppm) to those of authentic $5$. Authentic $5$ was prepared as above from commercially available benzoic acid $6$ (12.2 mg, 0.10 mmol). The yield was 80 % after purification.

8. Kinetic Study of The Reaction of RhPh(PCy$_3$)(dcype) 3 with CO$_2$ (Figure 3, 4)

In a glovebox, a solution of PCy$_3$ in toluene-$d_6$ was prepared by using volumetric flask. To an NMR tube were added 0.50 mL of this solution, RhPh(PCy$_3$)(dcype) 3 (4.4 mg, 0.005 mmol), and a sealed thin glass tube which contained a solution of 1,3,5-trimethoxybenzene (internal standard) in toluene-$d_6$. The system was degassed three times by freeze-pump-thaw technique at $-196 ^\circ C$, and then atmospheric pressure of CO$_2$ was introduced at $-78 ^\circ C$. The NMR tube was gently shaken at this temperature for a few minutes to dissolve sufficient CO$_2$. Then, the sample was gradually warmed to room temperature (22 ºC) and was kept shaken for a few minutes. (Note: This operation must be carried out under CO$_2$ flow to keep internal pressure at 1 atm.) During this, an intensive
evolution of CO$_2$ bubble was observed, suggesting the liquid phase was saturated with CO$_2$. After the system was closed, it was stored at $-78\, ^{\circ}C$ until starting to monitor the reaction. It was warmed again to room temperature being shaken just before the measurement. The reaction of 3 and CO$_2$ was monitored by $^1$H NMR at 35 $^{\circ}$C. The spectra were recorded in every 5 minutes. Consumption of 3 was monitored by comparing the intensity of the peaks of aromatic C-H (ortho to Rh, $\delta$ 7.9 ppm) with that of aromatic C-H of 1,3,5-trimethoxybenzene ($\delta$ 6.2 ppm). The quantitative formation of a new compound, which had a characteristic peak at $\delta$ 8.4 ppm (2H, d, $J = 6.5$ Hz), was also observed. $^{31}$P NMR spectra of the generated compound was consistent with those of Rh(O$_2$CPh)(PCy$_3$)(dcype) D', which was prepared as described above. Reactions were carried out using 0.050, 0.072, 0.10, and 0.20 M PCy$_3$ solutions in toluene-$d_8$. The reaction was almost first order to [3] and inverse first order to [PCy$_3$]. The linear correlation between $-\ln([3]/[3]_0)$ and the reaction time was maintained even after > 90 % consumption of 3 in the presence of 0.050 M PCy$_3$. The rate equations and the rate constants are given in eq. S3.

$$-\ln\left(\frac{[3]}{[3]_0}\right) = (k_{p_{H_1}}[PCy_3]^{-1} + k_{p_{H_2}})t, \quad k_{abs} = k_{p_{H_1}}[PCy_3]^{-1} + k_{p_{H_2}} \quad (S3)$$

$$k_{p_{H_1}} = 2.5 \times 10^{-2} \, [M \cdot min^{-1}]$$

$$k_{p_{H_2}} = 8.0 \times 10^{-3} \, [min^{-1}]$$

under CO$_2$ (1 atm at 22 $^{\circ}$C) at 35 $^{\circ}$C

The detailed results were summarized in Figure S12. The representative $^1$H NMR spectra during the measurement and the $^{31}$P NMR spectrum after the measurement were provided in Figure S13 and S14.
**Figure S12.** Kinetic study of carboxylation of 3 in toluene-$d_8$.

![NMR spectra graph](image2)
Figure S14. $^3$P NMR spectrum after the kinetic study of carboxylation of 3 (50 min, [PCy$_3$] = 0.050 M).

The same experiments were carried out by using RhMe(PCy$_3$)(dcype) 2. Consumption of 2 was monitored by comparing the intensity of the peaks of Rh–Me moiety ($\delta$ 0.3 ppm) with that of O–Me moiety of 1,3,5-trimethoxybenzene ($\delta$ 3.3 ppm). The reaction was first order to [2] and inverse first order to [PCy$_3$]. The rate equations and the rate constant are given in eq. S4.

\[
-ln(\frac{[2]}{[2]_0}) = k_{Me1}[PCy_3]^{-1}t, \quad k_{obs} = k_{Me1}[PCy_3]^{-1} \quad (S4)
\]

\[
k_{Me1} = 1.0 \times 10^{-3} \text{ [M} \cdot \text{min}^{-1}] \]

under CO$_2$ (1 atm at 22 °C) at 35 °C

The detailed results were summarized in Figure S15. The representative $^1$H NMR spectra during the measurement and the $^3$P NMR spectrum after the measurement were provided in Figure S16 and S17.

9. The Stoichiometric Reaction of 2 under CO$_2$ at 85 ºC (Scheme 8)

A solution of RhMe(PCy$_3$)(dcype) 2 (5.6 mg, 0.01 mmol) in benzene (0.5 mL) was added to an NMR tube. The system was purged with 1 atm CO$_2$ and then heated for 15 min at 85 ºC. After it was cooled to room temperature, the mixture was analyzed by $^{31}$P NMR. Its spectrum was identical to a mixture of carboxylates Rh(O$_2$CR)(dcype) and Rh(O$_2$CR)(PCy$_3$)(dcype) (benzoates and acetates were difficult to be distinguished on $^{31}$P NMR spectroscopy). The mixture was then treated with 1N HCl and extracted with ethyl acetate for three times. The combined organic layer was dried over MgSO$_4$, filtered and concentrated in vacuo. $^1$H NMR spectrum of the mixture in CDCl$_3$ indicated no formation of benzoic acid, which supported that the complexes observed in $^{31}$P NMR were both acetate Rh(OAc)(dcype) E and Rh(OAc)(PCy$_3$)(dcype) E'. 

S19
10. The Catalytic Carboxylation Reactions in Various Vessels (Table 1, 2)

The catalytic carboxylation reaction of benzene was carried out according to the general procedure provided in page 1 except for the reaction time of 1 h. The balloon was separately filled with CO\textsubscript{2} in advance and it was attached to the reaction vessel after the vessel was sufficiently purged with CO\textsubscript{2}. After the reaction, 1N HCl (2 mL) and diethyl ether (4 mL) were added to the reaction mixture after heating under CO\textsubscript{2}, and the mixture was stirred for 30 minutes at room temperature. Dodecane (internal standard) was added to the resulting mixture, which was diluted with methanol until it became homogeneous, and was analyzed by GC to quantify acetic acid. Diethyl ether was added to the mixture until it became heterogeneous. The organic layer was extracted with diethyl ether three times, and the extract was dried over MgSO\textsubscript{4}. Removal of the solvent gave a crude mixture, of which content of benzoic acid 6 was estimated by \textsuperscript{1}H NMR.

11. The in situ-IR Spectroscopy Experiment for The Observation of CO\textsubscript{2} in Toluene (Figure 5)

To a ca. 40 mL two-necked reaction vessel (test tube or round-bottom flask) equipped with an in-situ IR probe, degassed toluene (2 mL) was added under nitrogen atmosphere. The change in IR spectrum of the liquid phase was kept monitored during the following manipulations. After the spectrum became stabilized, the system was rapidly evacuated and purged with 1 atm CO\textsubscript{2} three times. The area of the peak at ca. 2350 cm\textsuperscript{-1} (an absorbance of CO\textsubscript{2}) was recorded every 20 seconds until it reached maximum. The results are summarized in Figure S18.

Figure S18. Dissolution of CO\textsubscript{2} in toluene.
12. Analysis of A Reaction Mixture by $^{31}$P NMR (Scheme 10)

A solution of $[\text{RhCl(dctype)}]_2$ I (2.8 mg, 0.0025 mmol), DMA (25 µL), TMU (1.5 µL, 0.013 mmol) and AlMe$_{1.5}$(OEt)$_{1.5}$ (33 mg, 0.28 mmol) in benzene (0.5 mL) was added to an NMR tube with a sealed glass tube which contained a benzene solution of PPh$_3$ as an internal standard. The mixture was analyzed by $^{31}$P NMR to estimate the initial content of I by comparing intensities of the peaks of I and PPh$_3$. The mixture was heated at 85 ºC in an oil bath, and its $^{31}$P NMR spectra were recorded after 1 h and 6 h. No significant change was observed after 1 h, but ca. 70 % of I was consumed to give many unidentified species after 6 h. Alternatively, almost no change was also observed after heating for 1 h when the reaction was carried out under CO$_2$.

13. The Reaction of Rh(O$_2$CPh)(dctype) D with AlMe$_{1.5}$(OEt)$_{1.5}$ (Scheme 11)

In a glovebox, Rh(O$_2$CPh)(dctype) D (2.9 mg, 5 x 10$^{-3}$ mmol) was dissolved in benzene (0.5 mL). A solution of AlMe$_{1.5}$(OEt)$_{1.5}$ (13 mg, 0.1 mmol) in benzene (0.2 mL) was added to this solution. The color of the mixture changed from yellow to orange, and then to dark yellow. $^{31}$P NMR analysis of the mixture suggested decomposition of D to give small amounts of unidentified complexes.

14. The Reaction of Rh(O$_2$CPh)(dctype) D with AlMe$_{1.5}$(OEt)$_{1.5}$ in The Presence of AlClMe$_2$ (Scheme 11)

In a glovebox, a solution of Rh(O$_2$CPh)(dctype) D (2.9 mg, 5 x 10$^{-3}$ mmol) in benzene (0.5 mL) was added to an NMR tube with a sealed glass tube which contained a benzene solution of PPh$_3$ as an internal standard. The mixture was analyzed by $^{31}$P NMR to estimate the initial content of D, by comparing intensities of the peaks of D and PPh$_3$. After this, a mixture of AlMe$_{1.5}$(OEt)$_{1.5}$ (13 mg, 0.1 mmol) and AlClMe$_2$ (1.0 M hexane solution, 5 µL, 5 x 10$^{-3}$ mmol) in benzene (0.2 mL) was added. A color of the mixture slightly changed from yellow to orange after the addition, but it turned again to yellow soon. $^{31}$P NMR analysis of the mixture suggested complete conversion of D to
[\text{RhCl(dctype)}]_2 \text{ I}. The yield was estimated to 60–70 \% according to relative intensity of the peaks of \text{I} to those of \text{PPh}_3.

15. The catalytic carboxylation of benzene using \text{Rh(O}_2\text{CPh)(dctype)} \text{ D}

The reaction was carried out according to the general procedure provided in page 1 except \text{Rh(O}_2\text{CPh)(dctype)} \text{ D} was used instead of [\text{RhCl(dctype)}]_2 \text{ I} and the chloride source (\text{AlMe}_2\text{Cl or NBu}_4\text{Cl, 0.01-0.05 mmol}) was added simultaneously with AlMe_{1.5}(\text{OEt})_{1.5}. The results are summarized in Table S1.

\textbf{Table S1.} Effect of chloride source in the carboxylation reaction by \text{Rh(O}_2\text{CPh)(dctype)} \text{ D}.

16. Methylation of \text{RhCl(PCy}_3\text{(dctype)} \text{ F} with AlMe_3 (ref. 24)

In a glovebox, [\text{RhCl(dctype)}]_2 \text{ I} (2.8 mg, 2.5 x 10^{-3} mmol) and PCy_3 (14 mg, 0.05 mmol) were dissolved in benzene (0.5 mL) and the mixture was stood at room temperature. After 11 h, the reaction mixture was analyzed by $^{31}$P NMR. The peaks of \text{I} almost disappeared and new three ddd peaks were observed at $\delta$ 83, 80, 27 ppm, suggesting the formation of \text{RhCl(PCy}_3\text{(dctype)} \text{ F} (detailed values are shown below), which had nonequivalent three phosphines. Then, the mixture was treated with AlMe_3 (neat, 4.8 $\mu$L, 0.05 mmol) in a glovebox at room temperature. After 1.5 h, the mixture was analyzed again by $^{31}$P NMR. The peaks of \text{F} completely disappeared and \text{2} was observed as a major product. Its $^{31}$P NMR spectrum was consistent with those of the authentic compound prepared as described above.
31P NMR spectrum of RhCl(PCS\textsubscript{3})(dcype) \textbf{F} in benzene: $\delta$ 83.3 (ddd, $J_{P-Rh} = 188$ Hz, $J_{P-P} = 31, 30$ Hz), 80.3 (ddd, $J_{P-Rh} = 140$ Hz, $J_{P-P} = 323, 31$ Hz), 27.4 (ddd, $J_{P-Rh} = 118$ Hz, $J_{P-P} = 323, 30$ Hz).

17. References

\textsuperscript{iii}: We have not determined whether rhodium carboxylates \textbf{D} and \textbf{E} are monomeric or dimeric completely. However, their FAB\textsuperscript{+} mass spectra indicate they are monomeric. In addition, related Rh(OAc)(P\textsubscript{i}Pr\textsubscript{3})\textsubscript{2} has monomeric structure in the solid state. See: Werner, H.; Martin, S.; Oliver, N.; Wolf, J. \textit{Chem. Ber.} \textbf{1994}, \textit{127}, 27–38.
