General methods. All regents and solvents were purchased from Sigma-Aldrich, Tokyo Chemical Industry (TCI), or Wako Pure Chemical Industries, and used as received unless otherwise noted. Methyl-2-(phenylamino)benzoate,¹ 9-phenyl-9H-3,9'-bicarbazole (CCP),² and 2,8-bis(diphenylphosphine oxide)dibenzofuran (PPF)³ were prepared according to previously reported procedures, and were further purified by temperature-gradient vacuum sublimation. 1,4,5,8,9,11-Hexaazatriphenylene-hexacarbonitrile (HAT-CN) was donated by the Nippon Soda Corporation, and was then purified by vacuum sublimation before use. Other OLED materials were purchased from E-Ray Optoelectronics Technology Corporation, and used for device fabrication without further purification. NMR spectra were recorded on Bruker Avance III 400 and 500 spectrometers. Chemical shifts of $^1$H and $^{13}$C NMR signals were referenced to tetramethylsilane ($\delta = 0.00$), CDCl$_3$ ($\delta = 77.0$), and DMSO-$d_6$ ($\delta = 39.5$) as internal standards, respectively. Matrix-assisted laser desorption ionization time-of-flight (MALDI-TOF) mass spectra were collected on a Bruker Daltonics Autoflex III spectrometer using dithranol as the matrix. Elemental analyses were performed using a Yanaco MT-5 CHN corder.

Quantum chemical calculations. Density functional theory (DFT) calculations for the pyrimidine-based molecules were performed using the Gaussian 09 program package. Geometries in the ground state were optimized using the PBE1PBE functional with the 6-31G(d) basis set in the gas phase. The lowest singlet and triplet excited states were computed using the optimized structures with time-dependent DFT (TD-DFT) at the same level. The PBE1PBE/6-31G(d) method can provide a better correlation with the experimental $\Delta E_{ST}$ than the standard B3LYP/6-31G(d) method, without increasing the computational time.

Photophysical characterizations. Organic thin films for photophysical measurements were prepared by vacuum deposition under high vacuum (~7×10$^{-5}$ Pa) onto a quartz glass or Si(100) substrate. UV/vis absorption and photoluminescence (PL) spectra were measured using a Jasco V-670 spectrometer and a Jasco FP-8600 spectrophotometer, respectively, using degassed spectral grade solvents. The absolute PL quantum yields ($\Phi_{PL}$) were measured using a Jasco ILF-835 integrating sphere system. The transient PL characteristics of the doped thin films were performed using a Quantaurus-Tau C11367 ($\lambda_{ex} = 340$ nm, pulse width = 100 ps, repetition rate = 20 Hz) under N$_2$ atmosphere, and a Hamamatsu Photonics C9300 streak camera with a N$_2$ gas laser ($\lambda_{ex} = 337$ nm, pulse width = 500 ps, and repetition rate = 20 Hz) under vacuum (<4×10$^{-7}$ Pa). The HOMO energy levels of the materials in the thin films were determined
using a Riken-Keiki AC-2 ultraviolet photoelectron spectrometer. The LUMO energy levels were estimated by subtracting the optical energy gap ($E_g$) from the measured HOMO energies; $E_g$ values were determined from the high energy onset position of the PL spectra of the thin films.

**OLED fabrication and measurements.** Indium tin oxide (ITO)-coated glass substrates were cleaned with detergent, deionized water, acetone, and isopropanol, and then subjected to UV-ozone treatment for 30 min, before loading into a vacuum evaporation system. The organic layers and a cathode aluminum layer were thermally evaporated through shadow masks under vacuum ($< 6 \times 10^{-5}$ Pa) with an evaporation rate of $< 0.3$ nm s$^{-1}$. The layer thickness and deposition rates were monitored in situ during deposition by an oscillating quartz thickness monitor. OLED properties were measured using a Keithley 2400 source meter and a Konica Minolta CS-2000 spectroradiometer.
Synthesis and characterization.

**Scheme S1.** Synthesis of 9,9-diphenyl-9,10-dihydroacridine (1).

**Synthesis of 9,9-diphenyl-9,10-dihydroacridine (1):** To a solution of methyl-2-(phenylamino)benzoate\(^1\) (18.0 g, 79.2 mmol) in dry THF (300 mL) was added dropwise phenyllithium (1.6 M, 148.5 mL, 237.6 mmol) at -78 °C under N\(_2\). The mixture was stirred for 1 h at -78 °C, and then further reacted for 2 h at 0 °C. After heating up to room temperature, the mixture was reacted for 4 h at room temperature, and then quenched by addition of a large amount of water. The product was extracted with chloroform and dried over anhydrous Na\(_2\)SO\(_4\). After filtration and evaporation, the crude product was used in the next reaction without further purification.

To a solution of 4 in chloroform (300 mL) was added methanesulfonic acid (8.4 g, 87.1 mmol) at room temperature. The mixture was refluxed for 1 h under air, and then further reacted for 12 h at room temperature. The reaction mixture was concentrated under reduced pressure. Then, the residue was purified by column chromatography on silica gel (hexane/chloroform = 3:1, v/v) to give 1 as a white solid (yield = 18.5 g, 70%). \(^1\)H NMR (500 MHz, CDCl\(_3\)): \(\delta\) 7.26-7.19 (m, 4H), 7.17-7.16 (m, 4H), 6.96-6.94 (m, 4H), 6.90-6.87 (m, 2H), 6.83 (dd, \(J = 7.8\) Hz, 1.5 Hz, 2H), 6.80 (dd, \(J = 7.9\) Hz, 1.1 Hz, 2H), 6.28 (s, 1H); MS (MALDI-TOF) \(m/z\) [\(M^+\)] calcd 333.15; found, 333.97.

**Synthesis of 10-(4-bromophenyl)-9,9-diphenyl-9,10-dihydroacridine (2):** A solution of 1 (15.0 g, 44.9 mmol) in 1,4-dioxane (150 mL) was added slowly sodium tert-butoxide (8.6 g, 89.8 mmol) at room temperature under N\(_2\). After stirred for 30 min, copper (I) iodide (0.85 g, 4.5 mmol), 1,10-phenanthroline (0.81 g, 4.5 mmol), and 4-bromoiodobenzene (15.2 g, 53.9 mmol) were added to the reaction mixture. The mixture was refluxed for 12 h. After cooling to room temperature, water (ca. 150 mL) was added to the reaction mixture. After filtered through a Celite pad, the product was extracted with chloroform and dried over anhydrous Na\(_2\)SO\(_4\). After filtration and evaporation, the product was purified by column chromatography on silica gel (hexane/chloroform = 10:1, v/v) to give 2 as a white solid (yield = 18.6 g, 85%). \(^1\)H NMR (400 MHz, DMSO-\(d_6\)): \(\delta\) 7.84-7.80 (m, 2H), 7.34-7.30 (m, 6H), 7.12-7.08 (m, 2H), 7.04-7.01 (m, 2H), 6.94-6.88 (m, 6H), 6.77 (dd, \(J = 8.0\) Hz, 1.6 Hz, 2H), 6.34 (dd, \(J = 8.3\) Hz, 1.0 Hz, 2H); MS...
Synthesis of 9,9-diphenyl-10-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)-9,10-dihydroacridine (3): To a solution of 2 (5.0 g, 10.2 mmol) in dry THF (400 mL) was added dropwise n-butyllithium (2.6 M, 4.7 mL, 12.3 mmol) at −78 °C under N₂. The mixture was stirred for 1 h at that temperature. Then, 2-isoproxy-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (2.3 g, 12.3 mmol) was added dropwise to the mixture at −78 °C. The reaction mixture was further stirred for 3 h at room temperature. The resulting mixture was added into water, and then extracted with chloroform. The combined organic layers were washed with water, and dried over anhydrous Na₂SO₄. After filtration and evaporation, the crude product was purified by column chromatography on silica gel (hexane/ethyl acetate = 10:1, v/v) to afford 3 as a white solid (yield = 4.0 g, 73%). ¹H NMR (400 MHz, DMSO-d₆): δ 7.92 (d, J = 8.0 Hz, 2H), 7.35-7.25 (m, 6H), 7.11-7.04 (m, 4H), 6.92-6.88 (m, 6H), 6.77 (dd, J = 7.6 Hz, 1.6 Hz, 2H), 6.29 (dd, J = 6.8 Hz, 0.8 Hz, 2H), 1.33 (s, 12H); MS (MALDI-TOF) m/z: [M+H]⁺ calcd 535.27; found, 535.88.

Synthesis of 2DPAc-PPM: This compound was synthesized according to the same procedure as described above for the synthesis of 2DPAc-MPM, except that fenclorim (0.34 g, 1.5 mmol) was used as the reactant instead of 4,6-dichloro-2-methylpyrimidine. 2DPAc-PPM was obtained as a light-yellow solid (yield = 2.36 g, 65%), and was further...
purified by temperature-gradient sublimation under vacuum. $^1$H NMR (400 MHz, DMSO-$d_6$): $\delta$ 8.77 (d, $J$ = 8.4 Hz, 4H), 8.74-8.71 (m, 3H), 7.64-7.61 (m, 3H), 7.38-7.28 (m, 16H), 7.13 (t, $J$ = 8.0 Hz, 4H), 6.96-6.93 (m, 12H), 6.81 (d, $J$ = 8.0 Hz, 4H), 6.48 (d, $J$ = 8.4 Hz, 4H); $^{13}$C NMR (125 MHz, CDCl$_3$, $\delta$): 164.22, 146.38, 143.42, 141.96, 137.81, 137.25, 131.90, 130.95, 130.41, 130.13, 129.79, 129.53, 128.58, 128.50, 127.67, 126.93, 126.32, 120.42, 114.10, 110.54, 56.79, 30.94; MS (MALDI-TOF) m/z: [M+H]$^+$ calcd 971.41; found, 971.51. Anal. calcd for C$_{72}$H$_{50}$N$_4$: C 89.04, H 5.19, N 5.77; found: C 89.13, H 5.09, N 5.84.

**Determination of rate constants.** The PL quantum efficiencies of the prompt component ($\Phi_p$) and delayed component ($\Phi_d$) are experimentally obtained from the emission intensity proportions of their components in the transient PL. The lifetimes of the prompt component ($\tau_p$) and delayed component ($\tau_d$) are determined by fitting the transient PL decay curve. In the presence of intersystem crossing (ISC) and reverse intersystem crossing (RISC) between the $S_1$ and $T_1$ states, the rate constants of the prompt component ($k_p$) and delayed component ($k_d$) can be expressed by the following formulas:

$$k_p = \frac{1}{\tau_p} = k_r^S + k_{nr}^S + k_{ISC}$$  \hspace{1cm} (1)$$

$$k_d = \frac{1}{\tau_d} = k_r^T + \left(1 - \frac{k_{ISC}}{k_r^S + k_{nr}^S + k_{ISC}}\right)k_{RISC}$$  \hspace{1cm} (2)$$

where $k_r^S$ and $k_{nr}^S$ are the radiative and non-radiative decay rate constants of the $S_1$ state, respectively, and $k_{ISC}$ and $k_{RISC}$ are the ISC ($S_1 \rightarrow T_1$) and RISC ($T_1 \rightarrow S_1$) rate constants, respectively. $k_r^S$ and $k_{ISC}$ are assumed to be much faster than $k_{nr}^T$ and $k_{RISC}$. The $\Phi_p$, $\Phi_d$, and $\Phi_{ISC}$ are given by the following formulas:

$$\Phi_p = \frac{k_r^S}{k_r^S + k_{nr}^S + k_{ISC}} = \frac{k_r^S}{k_p}$$  \hspace{1cm} (3)$$

$$\Phi_d = \sum_{k=1}^{\infty} (\Phi_{ISC} \Phi_{RISC})^k \Phi_p = \frac{\Phi_{ISC} \Phi_{RISC}}{1 - \Phi_{ISC} \Phi_{RISC}} \cdot \Phi_p$$  \hspace{1cm} (4)$$

$$\Phi_{ISC} = \frac{k_{ISC}}{k_r^S + k_{nr}^S + k_{ISC}} = \frac{k_{ISC}}{k_p}$$  \hspace{1cm} (5)$$

From Eqs. 1–5, the following equation can be obtained.

$$k_{RISC} = \frac{k_p k_d \Phi_d}{k_{ISC} \Phi_p}$$  \hspace{1cm} (6)$$

Since the $\Phi_p$ exhibits almost negligible temperature dependence, we assume that $k_{nr}^S \approx 0$ at 300 K. Based on Eqs. 1–6, $k_r^S$, $k_{ISC}$, and $k_{RISC}$ can be estimated, as listed in Table S2.
Table S1. TD-DFT calculation results. The lowest excited singlet (S₁) and triplet (T₁) energies, oscillator strength (f), and transition configurations of the pyrimidine derivatives calculated at the PBE1PBE/6-31G(d) level.
