(A) General information

Reactions were carried out using commercial available reagents in oven-dried apparatus. CH_2Cl_2 was dried over powdered CaH_2 and distilled under nitrogen. ^1H NMR spectra were recorded at 400 MHz. The chemical shifts were recorded in ppm relative to tetramethylsilane and with the solvent resonance as the internal standard. Data were reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, m = multiplet), coupling constants (Hz), integration. ^{13}C NMR data were collected at 100 MHz with complete proton decoupling. Chemical shifts were reported in ppm from the tetramethylsilane with the solvent resonance as internal standard. The preparation of 5-alkoxyoxazole compounds followed the literature.¹ Enantiomeric excesses were determined by HPLC analysis on Daicel Chiralcel IA, IB and IE in comparison with the authentic racemates. Optical rotations were reported as follows: $[\alpha]^\text{T}_D = (c: \text{g}/100 \text{ mL, in } \text{CH}_2\text{Cl}_2, D: 589 \text{ nm})$. HRMS was recorded on a commercial apparatus (ESI Source, TOF).

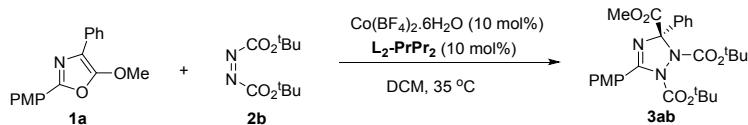

(B) Typical preparation procedure for 5-alkoxyoxazole compounds¹

The synthesis of all the 5-alkoxyoxazole compounds was according to the following preparation procedure. Add dropwise a solution of anisoyl chloride (3.41 g, 20 mmol) in CH_2Cl_2 (10 mL) to a suspension of glycine methyl ester hydrochloride (20 mmol) and triethylamine (4.83 mL, 44 mmol) in CH_2Cl_2 (30 mL) at 0 °C. After the reaction mixture was stirred at room temperature for 30 minutes, it was washed with aq. HCl (2 M, 20 mL), saturated aq. NaHCO_3 and saturated aq. NaCl, successively. Next the organic extract was dried (over NaSO_4) and concentrated under reduced pressure. Then the pure amide was obtained after recrystallization.

To a mixture of PPh_3 (2.62 g, 10 mmol) and I_2 (2.54 g, 10 mmol) in CH_2Cl_2 (25 mL) was added dropwise Et_3N (2.78 mL, 20 mmol) and stirred for 5–10 min. To this dark red solution was slowly added the amide (1.12 g, 5 mmol) in CH_2Cl_2 (15 mL) and the solution was stirred for 24 h. After concentration of the dark solution in vacuo, the residue was purified via flash silica gel column chromatography to get the 5-alkoxyoxazole compound.

(C) Typical procedure for asymmetric [3 + 2] reactions

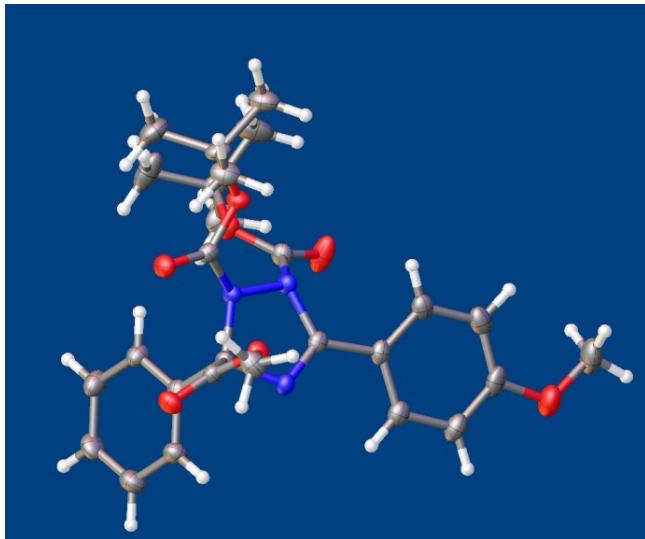

A dry reaction test tube was charged with $\text{L}_2\text{-PrPr}_2$ (10 mol%), $\text{Co}(\text{BF}_4)_2 \cdot 6\text{H}_2\text{O}$ (10 mol%), and CH_2Cl_2 (1.0 mL), and the mixture was stirred at 35 °C for 0.5 h. Then, the 5-alkoxyoxazole **1a** (0.1 mmol) and the azodicarboxylate **2b** (0.12 mmol) were added. After being stirred at 35 °C for 24 h, the pure product was obtained by flash chromatography on silica gel (PE/EA = 5:1).

(D) Scaled-up version of the asymmetric reaction

A dry reaction flask was charged with **L₂-PrPr₂** (10 mol%), Co(BF₄)₂.6H₂O (10 mol%) and THF (5.0 mL). After stirring at 35 °C for 0.5 h, the solvent was evaporated in vacuo. Next, the 5-alkoxyoxazole **1a** (3.0 mmol) and the azodicarboxylate **2b** (3.6 mmol) were added to the reaction flask, following the addition of DCM (30 mL). After being stirred at 35 °C for 24 h, the solvent was removed and the pure product **3ab** was obtained by flash chromatography on silica gel (PE/EA = 5:1).

(E) X-ray crystallographic structure of the product 3ab

Single crystal of **3ab** [C₂₇H₃₃N₃O₇] was obtained from the mixed solvents of ethyl acetate and petroleum ether. CCDC 1531931 containing the supplementary crystallographic data can be obtained free of charge from The Cambridge Crystallographic Data Center via www.ccdc.cam.ac.uk/data_request/cif.
