**General Methods.** All reactions were carried out under nitrogen atmosphere in dried solvents. THF, Et₂O and CH₂Cl₂ were dried in a PureSolv purification system from Innovative Technology, Inc. Toluene and deuterated solvents were purchased from Aldrich and used without further purification. Thin layer chromatography was carried out using TLC-aluminum sheets with silica gel (Merk 60 F₂₅₄). Chromatography purifications were carried out using flash grade silica gel (SDS Chromatogel 60 ACC, 35-70 μm). NMR spectra were recorded at 23°C on a Varian Mercury 400 and on a Varian Unity 300 spectrometres. ¹H NMR and ¹³C NMR spectra were referenced either to relative internal TMS or to residual solvent peaks. ³¹P NMR spectra were referenced to phosphoric acid. Signal multiplicities in the ¹³C spectra have been assigned by HSQC experiments. Optical rotations were recorded on a Perkin Elmer polarimeter at the sodium D line at room temperature (concentration in g/mL). Melting points were determined using a Büchi melting point apparatus and were not corrected. IR spectra were recorded in a FT-IR apparatus. HRMS were recorded using an electrospray ionization spectrometer. HPLC chromatography was performed on an Agilent Technologies Series 1100 chromatograph with UV detector. NaH as dispersion oil (60%w/w), DABCO, anhydrous triethylamine, pyrrolidine, methyl iodide, allyl bromide and 3-bromo-2-bromomethyl-1-propene were purchased from Aldrich and used without further purification. [Rh(COD)₂][BF₄] and NaBARF₄ were purchased from STREM Chemicals and used without further purification. Phosphinous acid ¹¹ and [Rh(COD)₂][BARF₄]² prepared following the literature procedure.

To a Schlenk tube containing 365 mg of methanesulfonic anhydride (2.10 mmol, 1.2 eq), a solution of 233 mg of 1 (1.75 mmol, 1.0 eq) in dichloromethane (10mL) was cannulated and the mixture was cooled at -20 ºC. 878 µL of triethylamine (6.30mmol, 3.0 eq) were added dropwise over 10 minutes and the mixture was allowed to react for 1 hour at -20 ºC. Then, a dichloromethane solution of 833 mg of tert-butyl carbazate (6.30 mmol, 3.0 eq) was cannulated and the mixture was stirred at -20 ºC overnight. After that time, the solution was allowed to warm at room
temperature, the organic phase was washed with 3x20 mL of HCl (aq) 1.0 M solution and 20 mL of brine, dried over anhydrous MgSO₄, filtrated and the solvent was removed under reduced pressure. The resulting solid was dissolved in 10 mL of dichloromethane and washed with 4x10 mL of NaOH (aq) 1.0 M solution, dried over anhydrous MgSO₄, filtrated and the solvent was removed under reduced pressure. Finally the product was eluted through a SiO₂ flash column with hexane:AcOEt (8:2) as eluting phase to yield 253 mg of a white solid. Yield: 58%.

In a Schlenk, 960 mg of 2 (3.87 mmol, 1.0 eq) were dissolved in 19 mL of a 1.25 M anhydrous solution of HCl in methanol. The mixture was stirred overnight at room temperature and NaOH (aq) 1.0 M solution was added until pH = 10. The solvent was evaporated under reduced pressure and the aqueous phase was extracted 4x12 mL of dichloromethane. The combined organic phase was washed with 20 mL of brine, dried over MgSO₄, filtrated and the solvent was removed under
reduced pressure to yield 520 mg of crude. The crude was eluted through a SiO\textsubscript{2} flash column with hexane:AcOEt (8:2) to yield 413 mg of a white pure product. Yield: 72%.

**Stepwise synthesis**

In a Schlenk tube, 1.030 g of methanesulfonic anhydride (5.92 mmol, 1.2 eq) were dissolved in 15 mL of dichloromethane. A solution of 660 mg of 1 (4.93 mmol, 1.0 eq) in dichloromethane was cannulated over the methanesulfonic anhydride solution. The mixture was cooled at -20 ºC and 2.06 mL of triethylamine (14.79 mmol, 3.0 eq) were added dropwise during 10 min. The mixture was allowed to react for 1 hour at -20 ºC, and then, a solution of 413 mg of 3 (2.79 mmol, 0.57 eq) was cannulated. The mixture was stirred overnight at -20 ºC. The organic phase was washed with 3x15 mL of HCl (aq) 1.0 M solution, 10 mL of NaOH (aq) 1.0 M solution and 15 mL of brine, dried over MgSO\textsubscript{4}, filtered and the solvent was removed under reduced pressure. The resulting crude was purified by elution through a SiO\textsubscript{2} flash column with DCM:TEA (97.5:2.5) to yield 410 mg of a crystalline colorless solid. Yield: 56%.

In a Schlenk tube, 1.170 g of methanesulfonic anhydride (6.72 mmol, 1.2 eq) were dissolved in 20 mL of dichloromethane. A solution of 750 mg of 1 (5.60 mmol, 1.0 eq) in dichloromethane was cannulated over the methanesulfonic anhydride solution. The mixture was cooled at -20 ºC and 2.33 mL of triethylamine (16.75 mmol, 3.0 eq) were added dropwise during 10 min. The mixture was allowed to react for 1 hour at -20 ºC, and then, 2.25 mL of 1.0M solution of hydrazine in THF (2.25 mmol, 0.4 eq) were added dropwise. The resulting mixture was stirred for 60 hours at -20 ºC. The organic phase was washed with 2x25 mL of brine, dried with Na₂SO₄, filtered and the solvent was removed under reduced pressure. The resulting of crude were purified by elution through SiO₂ flash column with hexane:AcOEt (95:5) to (80:20) as eluting phase to yield 488 mg of pure crystalline colorless crystalline solid. 1,2-bis((R)-tert-butyl(methyl)phosphanyl)-1,2-dimethylhydrazinebisborane (5)

A solution of 75 mg of 1,2-bis((R)-tert-butyl(methyl)phosphanyl)-1-methylhydrazine-bisborane (0.27 mmol, 1.0 eq) in 2 mL of THF was cannulated over a suspension of 44 mg of 60% NaH (1.08 mmol, 4.0 eq) in THF. The mixture was stirred at 55 ºC for 45 min. Then, 134 μL of MeI (2.16 mmol, 8.0 eq) were added and the resulting mixture was stirred at 55 ºC for 4h. The reaction
was followed by silica TLC (hexane:AcOEt 8:2) until the monomethylated product disappeared. Finally, the mixture was allowed to cool at room temperature and 5 mL of Et₂O were added. The excess of hydride was destroyed by a very slow addition of 4 mL of water. The organic phase was washed with 2x5 mL of brine, dried over anhydrous MgSO₄, filtered and the solvent was removed under reduced pressure to yield 75 mg of a pure colorless crystalline solid. During the TLC analysis two different spots were observed corresponding to two different atropoisomers undergoing rapid exchange. Yield: 95%.

General Procedure for the Rh-Catalysed Asymmetric Hydrogenations

Substrates (0.37, 3.7 or 18.5 mmol), and catalyst (0.0037 mmol) were weighed and placed into a pressure vessel. Anhydrous MeOH (1 or 2.5 mL) was added to the reaction mixture. The pressure vessel was pressure with 3 or 5 bar of H₂, the reaction mixtures were stirred overnight at room temperature. The autoclave was depressurized; the reaction mixture was filtered through a short pad of SiO₂ and subsequently eluted with EtOAc. The resulting solution was concentrated under vacuum. The conversion was determined by ¹H NMR and the enantiomeric excess was determined by GC or HPLC analysis on chiral stationary phases.

Pressure vessels for hydrogenations: Ace® glass pressure tube with Teflon screw-cap equipped with pressure gauge and valve.

Hydrogenation substrates

Methyl 2-acetamidoacrylate and dimethyl itaconate were commercially available (Sigma-Aldrich®). (Z)-Methyl 2-acetamido-3-phenylacrylate,³ and N-(1-Phenylvinyl)acetamide⁴ were prepared according to the cited literature procedures.
