1. General

General chemicals were purchased from Tokyo Chemical Industry, Wako Pure Chemicals, or Sigma-Aldrich Chemical Co., and used without further purification. $^1$H NMR spectra were recorded on JEOL JNM-EX400 spectrometer with tetramethylsilane (TMS) as the internal standard. Mass spectra were measured with a mass spectrometer (Autoflex Speed, Bruker). UV-vis absorption spectra were recorded on a Hitachi U-3310 spectrophotometer. Fluorescence spectra were measured with a Hitachi F-7000 fluorescence spectrophotometer. Irradiation experiments were carried out in a quartz cuvette using a Xe lamp (MAX-303, Asahi Spectra) equipped by narrow band interference filters (Semrock) or a monochromator (Horiba Jobin-Yvon).

3. Preparation of nanoparticles

Nanoparticles of PF-1 and PF-2 were prepared by the reprecipitation method in THF/water mixtures. The closed-ring isomers of PF-1 and PF-2 isolated by HPLC were dissolved into THF to obtain a 5.0×10⁻⁵ mol L⁻¹ solution. 0.6 mL of this solution was quickly added into 2.4 mL of distilled water under vigorous stirring during 5 min. Final suspension of NPs was obtained in H₂O/THF mixture with a concentration of 1.0×10⁻⁵ molL⁻¹ and it was diluted to appropriate concentration before use. The size of nanoparticles was estimated by SEM and AFM measurements and spherical nanoparticles with size of 30 ~ 60 nm were observed similar to our previous work.

4. Determination of conversion yields in nanoparticle state

In order to determine the conversion yield in nanoparticles, we prepared the nanoparticles of PF-1 and PF-2 from THF solution of the pure closed-ring isomer of each compound. The conversion yields of both compounds in the nanoparticle state were calculated based on the absorbance at 539 nm for PF-1 and 596 nm for PF-2, which were absorption maxima in the suspension of each nanoparticle. By comparing the absorbance at these wavelength to those of pure closed-ring isomers of each compound, we can estimate the conversion yield even in the nanoparticle state.
