General experimental procedure

All experimental manipulations were conducted using standard Schlenk line techniques or in an O2-free, N2-filled MBraun LABmaster SP dry box equipped with a -35 °C freezer, in either 4-dram glass vials with screw caps or in flame-dried Schlenk flasks. All proteo solvents (purchased from Caledon Laboratories) were purified using a Grubbs-type column system (Innovative Technologies) and stored over 4 Å sieves or sodium wire in Straus flasks. CDCl3 (Cambridge Isotopes) was dried using CaH2 and distilled under reduced pressure prior to use. All solvents were also degassed by repeated freeze-pump-thaw cycles prior to use. Benzyl alcohol, 4-bromobenzyl alcohol, cinnamyl alcohol, 5-norbornene-2-methanol (exo + endo), 4-methoxyphenol and trimethylsilanol were purchased from Sigma-Aldrich, 1,1-diphenylmethanol and cyclohexanol were purchased from Alfa Aesar, 2-phenoxyethanol and 4-bromophenylacetylene were purchased from TCI chemicals, and 2-hydroxybenzylamine was purchased from Apollo Chemicals. All liquid reagents were de-gassed by repeated freeze-pump-thaw cycles and stored over 4 Å sieves prior to use. All solid reagents were placed under vacuum for 1 h prior to use. Compound 1, was prepared using standard literature procedure.[1]

NMR spectroscopy was performed on either a Bruker Advance III 400 MHz, an Agilent DD2 500 MHz, or an Agilent DD2 600 MHz spectrometer. Unless otherwise stated, all spectra were obtained at room temperature. All NMR spectra were referenced to residual proteo solvent peaks (1H = 5.32 ppm and 13C = 53.84 ppm for CHCl3) or an external standard (19F: CFCI3 (δ 0.00), 11B: (Et2O)BF3 (δ 0.00), 125Te: Ph2Te2 (δ 420.8).[2]) Single-crystal X-ray crystallographic analyses were performed on crystals coated in Paratone-N oil and mounted on a Bruker Kappa Apex II diffractometer. The structure was solved using SHELXS and least square refinements were performed using SHELXL-97. Combustion elemental analyses were performed on a PerkinElmer CHN Analyzer.

General synthetic procedure for compounds 2-11

1 eq. of compound 1 and 1.1 eq. of alkyne were dissolved in 5 ml of acetonitrile. The yellow slurry was then transferred into a 50-ml Schlenk flask equipped with a Teflon tab seal. The solution was heated to 110 °C for 16 h, upon which point a crude 19F{1H} NMR spectrum was taken to ensure reaction completion. The reaction times of compounds 2-11 vary between 1 to 7 days as outlined in scheme 2 in the main article. Once the reaction was completed as determined by in situ 19F{1H} NMR spectra, all volatiles were removed under reduced pressure, and the product was extracted into 5 ml of DCM and filtered through a short plug of celite. The resulting clear yellow or orange solution was
then put under vacuum to remove all volatiles again before pentane was used to either precipitate out or recrystallize the product.

$^1$H (600.0 MHz, CDCl$_3$) NMR spectrum of 12
Compound 2 (116.3 mg, 0.1487 mmol) was reacted with 3-ethynylthiophene (51.0 mg, 0.472 mmol) in 4 ml of toluene at 110 °C for 16 h, giving a brownish-yellow and clear solution. After all volatiles were removed under vacuum, the residue was dissolved in 3 ml of pentane and passed through a plug of silica. 5 ml more of pentane was used to rinse out the C₆F₅CCPh from the silica plug. 5 ml of DCM was then used to extract 13 from the silica, giving again a clear and brownish yellow solution. All volatiles were removed again to give compound 13 (73.0 mg, 0.117, 78.9% yield) as a light yellow sticky solid.
$^1$H (600.0 MHz, CDCl$_3$): δ 7.46 (s, 1H, H(B)C=), 7.43 (m, 1H, Ar$^S$), 7.41 (m, 1H, Ar$^S$), 7.32 (app d, 2H, Ar), 7.28-7.23 (m, 6H, Ar), 7.20-7.17 (m, 4H, Ar), 5.22 (s, 2H, BOCH$_2$)
