I. General considerations

All reactions were carried out in oven-dried autoclave tube under a carbon monoxide atmosphere in an autoclave. Cyclohexane and DCE were both dried by activated 4 Å molecular sieve. Unless otherwise noted, materials were obtained from commercial suppliers and used without further purification. Thin-layer chromatography (TLC) employed glass 0.25 mm silica gel plates. Flash chromatography columns were packed with 200-300 mesh silica gel. Preparative thin-layer chromatography (PTLC) was InnoChem thin-layer chromatography silica gel plate (GF254-C-C). GC yields were recorded with a Shimadzu GC-2014 gas chromatograph instrument with a FID detector and biphenyl was added as an internal standard. ¹H and ¹³C NMR data were recorded with Bruker Advanced II (400 MHz) spectrometers with tetramethylsilane as an internal standard. All chemical shifts (δ) are reported in ppm and coupling constants (J) in Hz. All chemical shifts are reported relative to tetramethylsilane and d₇-solvent peaks (77.00 ppm, chloroform), respectively. High resolution mass spectra (HRMS) were measured with Waters Micromass GCT Premier instrument and Thermo Fisher Scientific LTQ Orbitrap Elite instrument, the accurate masses were reported for the molecular ion ([M]+) and the molecular ion + Hydrogen [M+H]⁺.

II. Radical oxidative carbonylation reactions

General Procedure A: In an oven-dried autoclave tube equipped with a stir-bar, cyclohexane (2.0 mL) and DCE (1.0 mL) were added to the autoclave tube via a syringe. Then, benzyl alcohol (0.20 mmol), DTBP (72 µL, 0.40 mmol) were added to the autoclave tube. After that, place the autoclave tube in an autoclave, then the autoclave was purged for three times and charged with CO at 40 bar. The reaction mixture was stirred at 120 °C for 10 hours and then cooled to room temperature. Next CO was carefully released. The corresponding reaction mixture was purified by preparative thin-layer chromatography to give the desired product using petroleum ether and ethyl acetate (20:1).

General Procedure B: In an oven-dried autoclave tube equipped with a stir-bar, ( trifluoromethyl)benzene (2.0 mL) and DCE (1.0 mL) were added to the autoclave tube via a syringe. Then, benzyl alcohol (0.20 mmol), DTBP (108 µL, 0.60 mmol) were added to the autoclave tube. After that, place the autoclave tube in an autoclave, then the autoclave was purged for three times and charged with CO at 20 bar, C₂H₆ at 40 bar. The reaction mixture was stirred at 120 °C for 10 hours and then cooled to room temperature. Next CO was carefully released. The corresponding reaction mixture was purified by preparative thin-layer chromatography to give the desired product using petroleum ether and ethyl acetate (20:1).

III. Gram scale reaction

In an 150 mL oven-dried autoclave reactor equipped with a stir-bar, cyclohexane (50.0 mL) and DCE (25.0 mL) were added to the autoclave reactor via a syringe. Then, benzyl alcohol (1.08 g, 10.0 mmol), DTBP (3.6 mL, 20.0 mmol) were added to the autoclave reactor. After that, place the autoclave reactor in an autoclave, then the autoclave was purged for three times and charged with CO at 40 bar. The reaction mixture was stirred at 120 °C for 10 hours and then cooled to room temperature. Next CO was carefully released. The corresponding reaction mixture was purified by flash column chromatography on a silica gel to give the desired product using petroleum ether and ethyl acetate (20:1).
IV. Mechanistic studies

A. Radical scavenger effect studies

a. Reaction in the presence of TEMPO

A mixture of cyclohexane (2.0 mL), DCE (1.0 mL), benzyl alcohol (0.2 mmol), DTBP (72 µL, 0.40 mmol) and TEMPO (62.4 mg, 0.4 mmol) were added to an autoclave tube placed in an autoclave. Then the autoclave was purged for three times and charged with CO at 40 bar. The reaction mixture was stirred at 120 °C for 10 hours and then cooled to room temperature. Next CO was carefully released. No desired product was observed.

b. Reaction in the presence of 1,1-diphenylethylene

A mixture of cyclohexane (2.0 mL), DCE (1.0 mL), benzyl alcohol (0.2 mmol), DTBP (72 µL, 0.40 mmol) and 1,1-diphenylethylene (72.0 mg, 0.4 mmol) were added to an autoclave tube placed in an autoclave. Then the autoclave was purged for three times and charged with CO at 40 bar. The reaction mixture was stirred at 120 °C for 10 hours and then cooled to room temperature. Next CO was carefully released. No desired product was observed. The yield (based on DTBP) of 6a and 6b were determined by $^1$H NMR analysis employing diphenyl methane as the internal standard.
