General Considerations

Reactions were performed using standard glassware or were run in 2-dram vials with PTFE/Liner screw caps. Column chromatography was performed on 60Å silica gel (Silicycle). The $^1$H, $^{13}$C, $^{19}$F and 2D-NMR spectra were recorded on JEOL EC-400, JEOL EC-500, or JEOL EC-600 spectrometers using residual solvent peak as a reference. Analytical thin layer chromatography was performed on silica gel TLC Al foils with fluorescent indicator (254 nm) from Fluka. Low temperature reactions were performed using Cryo Immersion Cooler FC100 with Flexi Probe from SP Scientific. All procedures were performed under ambient air unless otherwise noted. Reagents and starting materials were obtained from commercial sources and used without further purification unless otherwise noted. Complex $^{3}$ and NaBArF (sodium tetrakis[3,5-bis(trifluoromethyl)phenyl]borate)$^{2}$ were prepared according to literature procedure. Hexene was distilled from sodium under nitrogen. Methylene chloride was purified on a Glasscontour solvent purification system.
Synthesis of New Starting Materials

3-tert-Butyldimethylsiloxymethylcyclohexene

Intermediate alcohol was produced by a known procedure. In a glove box K<sub>O</sub>T<sub>Bu</sub> (1.68 g, 15 mmol) was added to a 100 mL oven dried round bottom flask equipped with a stir bar. Outside the glovebox, cyclohexene (19.5 mL) was added via syringe and the suspension was cooled to 0 °C. nBuLi (10.3 mL of a 1.6 M solution in hexanes, 16.5 mmol) was added slowly and the mixture was stirred for 2 hours, warmed to room temperature, and stirred overnight. The solution was heated to 60 °C and paraformaldehyde (495 mg, 16.5 mmol) was added slowly in 3 portions. The mixture was heated for 3 h at 60 °C. The reaction was quenched at 0 °C by addition of NH<sub>4</sub>Cl (aq) and the organic layer was extracted with CH<sub>2</sub>Cl<sub>2</sub>. The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. The crude mixture was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (30 mL) and cooled to 0 °C. Imidazole (1.12 g, 16.5 mmol) was added with stirring followed by TBSCI (2.49 g, 16.5 mmol). The mixture was stirred overnight at room temperature and quenched by addition of NH<sub>4</sub>Cl (aq). The organic layer was separated, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated. The mixture was concentrated on silica and purified by column chromatography on silica gel (elucent: pentane) to give 1.14 g of 3-tert-butyldimethylsiloxymethylcyclohexene (34%) as a clear liquid. R<sub>f</sub> (pentane) = 0.40

Reaction Optimization

General Procedure for Optimization Reactions

A 2-dram vial with a screw cap (PTFE/Liner) equipped with a magnetic stir bar was charged with NaB[(C₆H₄(CF₃)₂)₄ (7 mg, 8 μmol) and tert-butyldimethyl(allyloxy)silane (1 mmol). A freshly prepared solution of catalyst (20 mM in CDCl₃, 0.1 mL, 2 μmol) was added to the vial. The vial was sealed, placed in cooling bath at 0 ºC and allowed to stir for the specified time. After the reaction had finished, a solution of nBu₄NCl in CDCl₃ (>20 equiv relative to catalyst) was added and the mixture was shaken to terminate the reaction. An internal standard, 1,4-bis(trifluoromethyl)benzene (7.8 μL, 0.050 mmol) was added to the vial and the whole reaction mixture was transferred to an NMR tube. Yields were determined by NMR. Spectra were taken with relaxation time of 20 seconds.

Isomerization of Olefins

General Procedure for Isomerization of Olefins

A 2-dram vial with a screw cap (PTFE/Liner) equipped with a magnetic stir bar was charged with NaB[(C₆H₄(CF₃)₂)₄ (7 mg, 8 μmol) and olefin (0.2 mmol). A freshly prepared solution of 3 (20 mM in CDCl₃, 0.1 mL, 2 μmol) was added to the vial. The vial was sealed, placed in a cooling bath at the indicated temperature and allowed to stir for the specified time. After the reaction had finished, a solution of nBu₄NCl in CDCl₃ (>20 equiv relative to catalyst) was added and the mixture was shaken to terminate the reaction. An internal standard, 1,4-bis(trifluoromethyl)benzene (7.8 μL, 0.050 mmol) was added to the vial and the whole reaction mixture was transferred to an NMR tube. Either the allylic –CH₃, allylic –CH₂, or the olefin signal was used for quantification based on the best resolution in the spectra. Spectra were taken with relaxation time of 20 seconds. The signal used for quantification is designated in bold in each entry.
